CONTENTS (Continued)

Chapter		Page
	4.2.5 Remove litter, trash and debris from the roadside and the right-of-way to keep roadways within Douglas County aesthetically pleasant	39
	4.2.6 Implement selected near-term traffic safety and traffic operations improvements from 2017 to 2020	39
	4.2.7 Implement mid-term road improvements to provide acceptable traffic operations from 2017 to 2025	39
	4.2.8 Implement long-term road improvements to provide capacity and mobility from 2026 to 2040	39
	4.2.9 Maintain a level of service “D” on all NDOT roads within Douglas County, consistent with NDOT standards.....	39
	4.2.10 Develop a “pedestrian-friendly” U.S. 395/Main Street corridor through Minden and Gardnerville	40
	4.2.11 Support NDOT projects that maintain traffic flow (high speed and capacity) on U.S. 395 between Minden and Carson City, as identified in the U.S. 395 Southern Sierra Corridor Study (2007) ..	40
	4.2.12 Support possible bypass facilities to keep traffic moving through Minden and Gardnerville	40
	4.2.13 Develop a truck routes plan to keep excessive through traffic out of neighborhoods	41
	4.2.14 Resolve/prevent neighborhood traffic issues by providing adequate through traffic facilities on major collectors and arterials	41
	4.2.15 Provide traffic transitional facilities (such as traffic circles/roundabouts) in the Minden/Gardnerville area	41
	4.2.16 Maintain a current map of proposed Douglas County transportation improvement projects	41
	4.2.17 Maintain current design standards for Douglas County roadway classifications as identified in the <i>Douglas County Design Criteria and Improvements Standard Manual</i>	41
	4.2.18 Maintain a traffic level of service “C” or better on all Douglas County streets and roadways	42
	4.2.19 Provide transitional facilities between higher and lower classes of roadway functional types	42
4.3	Transportation Capital Improvement Projects	42

2017 Douglas County Transportation Plan

EXECUTIVE SUMMARY

Douglas County is responsible for developing and maintaining a long-term regional transportation plan that coordinates implementation of transportation infrastructure and programs. The county prepared a transportation plan in 1993, which was revised in 1996 and again in 2007 as a part of the county's master plan update. In the interests of maintaining a plan that reflects the current conditions and future needs of the community, Douglas County officials contracted with Parsons in 2015 to assist county staff with updating the transportation plan.

Transportation trends indicate that between 2004 and 2011, vehicle miles traveled (VMT) in Douglas County decreased markedly—by 33.6 percent. From 2011 to 2013, VMT increased slightly by eight percent. According to the Federal Highway Administration (FHWA), these changes can be attributed somewhat to the changing economic situation in the United States. The 2008-2009 recession and prolonged recovery, which continues at the time of the writing of this report, contributed to the decline and then subsequent increase in VMT which continues to the current year. Douglas County population growth slowed considerably during the years 2000-2010, increasing by just 5,800 during those ten years. For this reason, county policymakers decided that the transportation plan update would analyze the need for proposed transportation projects based on population projections using a revised set of growth assumptions.

The *2017 Douglas County Transportation Plan* (the Plan) contains the complete list of goals and policies in Chapter 1, Introduction, with each subsequent chapter listing the goals and policies relevant to that chapter. The Plan identifies transportation improvement projects needed to maintain acceptable transportation levels of service by 2025 and 2040, as well as identifying projects recommended as safety improvements.

The *2017 Douglas County Transportation Plan* uses 2040 as the horizon year for planning purposes. As Douglas County continues to grow beyond that date, new transportation facilities will need to be planned and implemented to accommodate future growth.

Historic and Projected Growth

According to the U.S. Census Bureau, the 2010 Douglas County population was 46,997, an increase of 13.9 percent over the 2000 population of 41,259. This rate of growth is in the middle range of Nevada counties, substantially less than Clark County (41.8 percent), Lyon County (50.7 percent), Nye County (35.3 percent) and Washoe County (24.1 percent), and slightly more than White Pine County (9.3 percent).

Douglas County Community Development issued 4,502 residential building permits from 2000 through 2015. The majority of those permits were issued from 2000 through 2006. The number of permits dropped substantially after 2006. In the past few years the number of permits issued annually has begun to grow. The 2010 census shows an average of 2.39 persons per occupied dwelling unit. For the *2017 Douglas County Transportation Plan*, a 2040 population of 70,400 has been established for the purposes of travel demand forecasting. The 2040 population

2017 Douglas County Transportation Plan

projection reflects a 1.39 percent annually compounded growth rate over the State Demographer estimate of 48,478 for 2013.

Douglas County/Carson City Travel Demand Model

Transportation policy makers rely on travel analysis tools to evaluate the impacts of land use development and the need for infrastructure improvements. A travel demand model is one of the key technical analysis tools used for this evaluation. It uses a complex computer program to provide answers to “what if” questions about the effects of proposed development and land use policies. The model predicts travel behavior and travel demand within a specific area, over a particular time period.

A travel demand model uses a four-step process to create a simulation of current and future travel demands.

- Step 1. Trip generation (how many trips will people make?)
- Step 2. Trip distribution (where will people go?)
- Step 3. Mode choice (which methods will people use to travel?)
- Step 4. Trip assignment (what routes will people use?)

To provide a more accurate evaluation of travel patterns, the model encompasses transportation patterns in both Douglas County and Carson City. In addition to reflecting the regional nature of travel in these two counties, the shared model provides an opportunity to assist policy makers with coordinating proposed land use and transportation improvements.

Comparing the model results with actual traffic counts on the roadways indicates that the model was operating very accurately. This “model validation” took place using traffic counts at 69 locations in Douglas County and 103 locations in Carson City. These were a combination of 2014 Nevada Department of Transportation counts and 2015 counts by Parsons. The counts showed an overall total deviation between the travel model and the actual traffic counts of about three to eight percent (AM/PM, off peak and daily), which is within allowable tolerances for planning purposes as described in Appendix A, Douglas County/Carson City Travel Demand Model report.

In addition to validating the model for the base year 2015, Parsons ran the traffic model for the years 2025 and 2040 to determine the transportation system needs in the future. Based on the model results, completing the lists of proposed projects in Chapter 4 will allow Douglas County to maintain an acceptable traffic level of service (LOS) C at all of the critical locations on county roads for each of those planning years.

Streets and Highways Element

Chapter 4, the Streets and Highways section of the *2017 Douglas County Transportation Plan* discusses the existing and proposed future transportation network. This section explains the

2017 Douglas County Transportation Plan

methods used for quantifying the transportation network, such as traffic counts on Douglas County streets and highways, classification of streets into arterials, collectors and roadways; and methods for determining the traffic level of service. The section also discusses the major roadway issues in Douglas County, along with specific policies to maintain and improve the transportation network. Finally, this section includes two lists of capacity-improving projects; one for construction between 2017 and 2025, and another for construction between 2026 and 2040. Figure ES.1 provides a map of the Douglas County roadway network indicating the functional classification of the roads.

A significant transportation issue in Douglas County is the concern about traffic safety and capacity along the U.S. 395 corridor through the towns of Gardnerville and Minden. U.S. 395 is the primary corridor through Carson Valley, with a limited number of parallel roads that could absorb any through traffic. In addition, U.S. 395 transitions into historic Main Street through the towns of Gardnerville and Minden. The County and the towns all want a more pedestrian-friendly downtown.

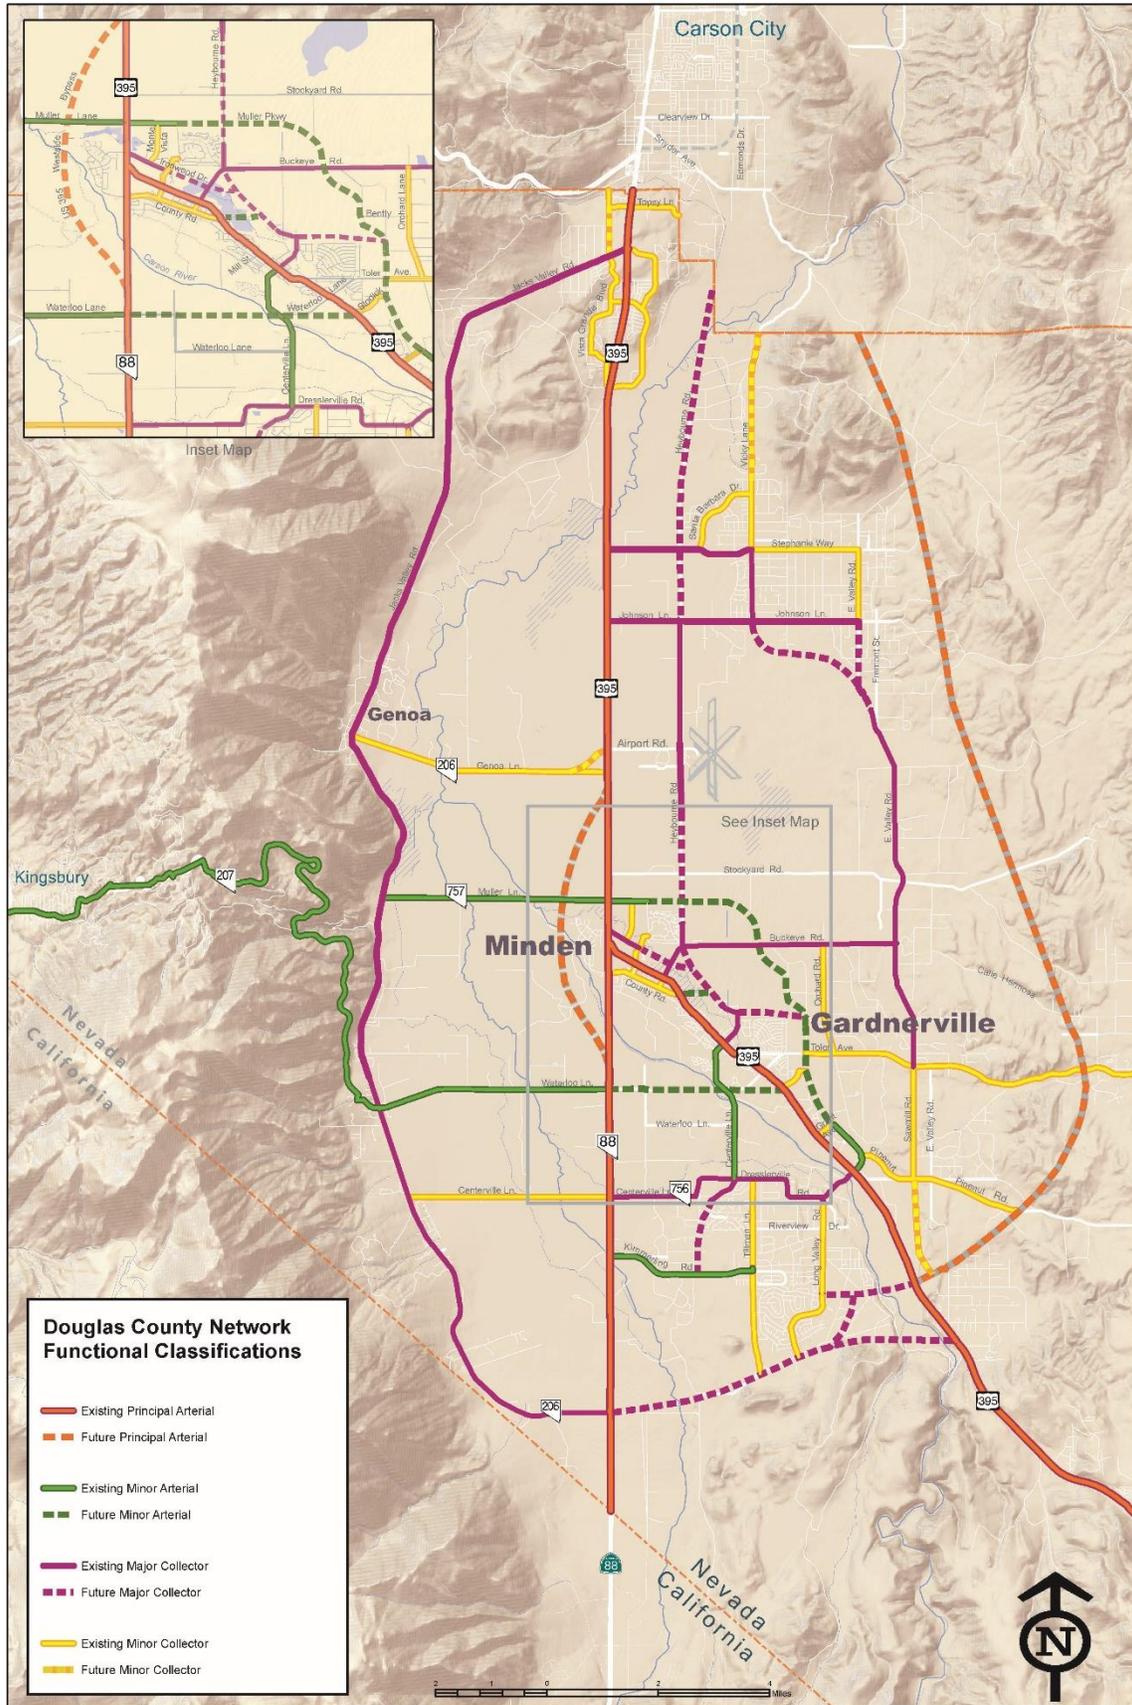

Douglas County has grown slowly over the past 10 years. Although there are currently failures in the Level of Service on U.S. 395 between Minden and Carson City (LOS lower than level D), the existing County-maintained transportation infrastructure has been able to adequately cope with the effects of this growth, maintaining traffic flow with LOS C or better. The additional trips created by new development in both Douglas County and Carson City will add to existing traffic volumes, causing some additional roadway segments to fall below acceptable Levels of Service unless new transportation projects are constructed.

Public Transportation Element

Public transportation is an important part of the overall transportation system, providing mobility to residents who do not have access to private vehicle usage, such as low income persons, the elderly, and persons with disabilities. In addition to providing mobility within Douglas County, public transit allows residents to access regional employment, education and health care services located in the Carson City and Reno/Sparks area. Public transit also has the potential to reduce roadway congestion by reducing the number of vehicles on the road.

Douglas County operates the Douglas Area Rural Transit (DART) Dial-A-Ride service, which carries passengers between the southernmost and northernmost points of the county along the U.S. 395 corridor. It also operates DART Express, a fixed route with a fixed schedule serving the Minden-Gardnerville and Gardnerville Ranchos areas. Douglas County provides transit service in the Lake Tahoe area under a private contract. The BlueGo Bus Service operates along U.S. 50 from Zephyr Cove to Stateline and along the Kingsbury Grade. The Regional Transportation Commission of Washoe County funds and operates an intercity bus service between north Douglas County and the Meadowood Mall, the Reno/Tahoe Airport and downtown Reno.

Figure ES.1: Douglas County Roadway Network Functional Classifications

2017 Douglas County Transportation Plan

As Douglas County continues to focus growth in the Minden/Gardnerville area and along U.S. 395, residents will expect and need a more active transit service in this corridor. The estimated increase in population to 70,400 by 2040 will likely require the development of more frequent fixed route service and demand responsive service covering a wider geographical area. Increased tourist and employment activity in the Lake Tahoe and Carson Valley areas will also provide opportunities for increased use of public transportation in Douglas County.

This plan recommends that Douglas County prepare a short-range transit plan to determine the costs, benefits and logistics of improving local transit services. The proposed transit plan should include evaluation of the existing and future transit projects identified in the County's 5-Year Transportation Plan, and should consider expanded transit service hours, area and frequency of service, and compliance with the Americans with Disabilities Act.

Bicycle/Pedestrian/Trails Element

The *2003 Douglas County Bicycle/Pedestrian/Trails Plan* and the *2014 Douglas County Bicycle Plan* are separate documents that are incorporated by reference in their entirety into the *2017 Douglas County Transportation Plan*.

Aviation Element

The *2008 Minden–Tahoe Airport Plan* is a separate document, which is incorporated by reference in its entirety into the *2017 Douglas County Transportation Plan*.

Financial Element

The Financial Element lists the financial policies approved in the Transportation Element (Chapter 5) of the 2011 Master Plan. The discussion of funding options has been removed from this 2017 update to the Douglas County Transportation Plan.

Lake Tahoe Element

The *2007 Douglas County Transportation Plan* did not address the Lake Tahoe area, nor does this updated plan evaluate the need for projects within the Lake Tahoe Basin. Nevertheless, to provide for continuity with the Transportation Element (Chapter 5) of the 2011 Master Plan, and to provide a complete list of the Transportation policies in this document, the Lake Tahoe Element has been added to this 2017 plan which lists the policies and actions from the 2011 Master Plan relative to the Tahoe area. This element also references the planning agencies and planning documents for the area.

2017 Douglas County Transportation Plan

Chapter 1 INTRODUCTION

1.1 Overview

Douglas County is located in northern Nevada just south of the state capital, Carson City, and about 35 miles south of the state's third largest city, Reno. Containing 735 square miles of valley floor, rolling hills and steep mountains, Douglas County is less than 130 miles from the Sacramento metropolitan area and less than 220 miles from the San Francisco/San Jose metropolitan area. The rural character, excellent climate and beautiful scenery make Douglas County a desirable place to live.

The county has grown from a small, predominantly agricultural community in the 1960's to an urbanized population center today. Douglas County population grew most rapidly during the 1970's, experiencing steady growth until 2000. From 2000 to 2010, population growth in the county slowed significantly, increasing by just 5,800 during those ten years. The U.S. Census Bureau's estimated 2014 population figures indicate that Nevada is the second-fastest growing state in the nation, with a total population of 2.8 million people. Based on a 2013 population of 48,478 (State Demographer's estimate) and an increase of 1.39 percent per year (the historic growth rate identified in the 2011 Master Plan), compounded annually, the 2040 population of Douglas County will be approximately 70,400 persons.

Transportation trends reported by the Nevada Department of Transportation indicate that between 2004 and 2011, vehicle miles traveled (VMT) in Douglas County decreased markedly—by 33.6 percent. From 2011 to 2013, VMT increased slightly by eight percent. According to the Federal Highway Administration (FHWA), these changes can be attributed somewhat to the changing economic situation in the United States. The 2008–2009 recession and prolonged recovery, which continues at the time of the writing of this report, contributed to the decline and then subsequent increase in VMT which continues to the current year.

For this reason, county policymakers decided that the transportation plan update would analyze the need for proposed transportation projects based on revised population projections using an updated travel demand model.

The *2017 Douglas County Transportation Plan* contains the complete list of goals and policies in Chapter 1, Introduction, with each subsequent chapter listing the goals and policies relevant to that chapter.

1.2 Updating the 2007 Transportation Plan

Douglas County is responsible for developing and maintaining a long-term regional transportation plan that coordinates implementation of transportation infrastructure and programs. Douglas County prepared a transportation plan in 1993, which was revised in 1996

2017 Douglas County Transportation Plan

as a part of the county's master plan update. In 2005, county officials contracted with Parsons to update the transportation plan for 2007. Parsons has again been designated to update the Transportation Plan section of the Douglas County Master Plan for the year 2017.

The *2017 Douglas County Transportation Plan* update began in 2015 with the collection of traffic data on every arterial and collector in the Carson Valley. It continued with a roadway capacity analysis to determine the existing traffic level of service (LOS) on major arterial streets in Douglas County during morning and evening peak periods. Using U.S. census data, Douglas County tax parcel information, state provided employment records and land use information, Parsons updated the traffic demand model they developed in 2007 to simulate travel between traffic analysis zones. Using projections about future growth levels from the county's land use plans and information on approved projects, the travel model shows where people travel now and predicts where they will travel in the future.

Knowing where and when people will travel allows transportation planners to determine which transportation facility improvements are required to keep traffic flowing at an acceptable level of service, which is LOS C for Douglas County maintained roads, and LOS D for Nevada Department of Transportation roads. The Plan was then updated to identify of specific projects with timeframes for completion to maintain acceptable levels of service. By linking transportation improvements to areas of increasing population, Douglas County residents will continue to enjoy relatively free flowing traffic conditions.

The most recent version of the traffic model is based on land use decisions made by Douglas County officials and assumptions made by Douglas County staff. As land use decisions change and different projects are completed on different time schedules, county staff will be able to monitor population, employment and travel data. Future transportation plan updates will adjust the traffic model to reflect these changes. The travel forecast model also takes into account the existing and future traffic patterns of areas outside Douglas County. By examining the land use and traffic patterns of the adjacent governmental entities including Carson City, Washoe County and Lyon County, the Douglas County model more accurately reflects the current and future traffic conditions.

1.3 Goals and Policies of the Transportation Plan

The goals and policies represent the guiding principles of the transportation plan for Douglas County in the Carson Valley and Topaz planning areas. Goals, policies and objectives for the Lake Tahoe planning area are contained in the *Lake Tahoe Regional Plan*, prepared by the Tahoe Regional Planning Agency and approved in February 2013.

2017 Douglas County Transportation Plan

1.3.1 GOALS

The following are the overarching goals of the Transportation Plan:

- GOAL 1: Provide and maintain an integrated transportation system for the safe, efficient movement of people and goods throughout Douglas County.
- GOAL 2: Provide appropriate transportation facilities to ensure a high quality-of-life for Douglas County residents.

1.3.2 POLICIES

The following policies form the basis for implementation of the goals identified above. These policies are also identified in the chapters that follow.

Chapter 2: Historic and Projected Growth

- 2.3.1 Evaluate the impacts of current and planned development in Douglas County.
- 2.3.2 Coordinate transportation planning and land use development.

Chapter 3: Travel Demand Model

- 3.4.1 Update the travel demand model on a regular basis, at least every ten years.
- 3.4.2 Maintain accurate data on population, employment and average daily traffic to facilitate travel model update.

Chapter 4: Streets and Highways Element

- 4.2.1 Identify high accident locations and take appropriate actions to ensure continued public health and safety.
- 4.2.2 Provide appropriate traffic control devices on new and existing transportation facilities.
- 4.2.3 Protect public safety by removing snow and other hazards from roadways.
- 4.2.4 Post appropriate speed limits based on current speed limit studies.
- 4.2.5 Remove litter, trash and debris from the roadside and the right-of-way to keep roadways within Douglas County aesthetically pleasant.
- 4.2.6 Implement near-term traffic safety and traffic operations improvements from 2017 to 2020.
- 4.2.7 Implement mid-term road improvements to provide acceptable traffic operations from 2017 to 2025.
- 4.2.8 Implement long-term road improvements to provide capacity and mobility from 2025 to 2040.

2017 Douglas County Transportation Plan

- 4.2.9 Maintain a traffic level of service “D” on all NDOT roads within Douglas County, consistent with NDOT standards.
- 4.2.10 Develop a “pedestrian-friendly” U.S. 395/Main Street corridor through Minden and Gardnerville.
- 4.2.11 Support NDOT projects that maintain traffic flow (high speed and capacity) on U.S. 395 between Minden and Carson City, as identified in the U.S. 395 Southern Sierra Corridor Study (2007).
- 4.2.12 Support possible bypass facilities to keep traffic moving through Minden and Gardnerville.
- 4.2.13 Develop a truck routes plan to keep excessive through traffic out of neighborhoods.
- 4.2.14 Resolve/prevent neighborhood traffic issues by providing adequate through traffic facilities on major collectors and arterials.
- 4.2.15 Provide traffic transitional facilities (such as traffic circles/roundabouts) in the Minden/Gardnerville area.
- 4.2.16 Maintain a current map of proposed Douglas County transportation improvement projects.
- 4.2.17 Maintain current design standards for Douglas County roadway classifications as identified in the Douglas County Design Criteria and Improvements Standard Manual.
- 4.2.18 Maintain a level of service “C” or better on all Douglas County streets and roadways.
- 4.2.19 Provide transitional facilities between higher and lower classes of roadway functional types.

Chapter 5: Public Transportation Element

- 5.5.1 Provide general public transit service to Douglas County residents and visitors.
- 5.5.2 Provide transit services to the elderly and persons with disabilities, as required by the Americans with Disabilities Act (ADA).
- 5.5.3 Provide regional public transit, connecting Douglas County residents and visitors with Carson City, Washoe County and Alpine County (California).
- 5.5.4 Promote use of local and regional public transit serving Douglas County residents and visitors.
- 5.5.5 Develop public transit goals and objectives to measure and evaluate transit system performance.
- 5.5.6 Annually review performance measures and indicators for existing transit services and adjust services accordingly.

2017 Douglas County Transportation Plan

- 5.5.7 Prepare a short range transit plan, including a five-year transit project list, which identifies transit needs, and potential service improvements along with a financial plan.
- 5.5.8 Establish and preserve a transportation corridor in the vicinity of the former Virginia & Truckee Railroad right-of-way between Minden and the Carson City line, parallel to Heybourne Road.
- 5.5.9 Evaluate the feasibility of providing rubber-tire transit service to initially serve major travel destinations as development occurs along the Heybourne Road corridor. Identify potential private and public funding sources to establish and maintain service.

Chapter 6: Bicycle/Pedestrian/Trail Element

- 6.1.1 Maintain and implement the adopted Douglas County Comprehensive Trails Plan to provide opportunities for non-motorized transportation within the county that meets both recreational and commuter needs.
- 6.1.2 Ensure development and maintenance of multi-purpose (hiking, equestrian, bikeway and off-road bicycle) trail systems throughout Douglas County, connecting with public lands and recreational facilities of local and regional interest.
- 6.1.3 Maintain and implement the adopted Douglas County Bicycle Plan.

Chapter 7: Airport Element

- 7.1.1 Provide for safe continuation and expansion of the Minden–Tahoe Airport.

Chapter 8: Financial Element

- 8.1.1 Coordinate with the NDOT to implement capital and operational improvements on state facilities in a timely manner.
- 8.1.2 Develop funding mechanisms to implement system-wide capacity and operational system improvements to the street and highway network.
- 8.1.3 Develop funding mechanisms to maintain the existing street and highway network.
- 8.1.4 Develop funding mechanisms to implement public transportation system improvements.
- 8.1.5 Develop funding mechanisms to implement improvements to the bicycle/pedestrian/trails system.
- 8.1.6 Develop funding mechanisms to implement improvements at the Minden–Tahoe Airport.

2017 Douglas County Transportation Plan

- 8.1.7 Explore the development and implementation of a traffic impact fee program to fund regional capacity improvements on the street and highway network.
- 8.1.8 Develop and maintain a coordinated transportation plan of proposed transportation facility improvements in collaboration with adjacent jurisdictions.
- 8.1.9 Construct and maintain necessary street and road facilities in rural and urban settings to maintain a high quality-of-life in Douglas County. (See Complete Streets Policy dated January 19, 2016.)

Chapter 9: Lake Tahoe Element

LT Policy 1: Participate and support the planning, design and implementation of transportation projects and transit improvements at Lake Tahoe consistent with the Tahoe Revitalization initiative of the County Economic Vitality Plan and other needs identified through the annual update of the County 5-Year Transportation Plan, County Transportation Plan, and plans of the TRPA, TMPO and TTD.

2017 Douglas County Transportation Plan

Chapter 2 HISTORIC AND PROJECTED GROWTH

The *2017 Douglas County Transportation Plan* incorporates information about current land use development and the existing transportation network along with projections about future development and improvements. To develop this information, Parsons collected data from the U.S. Census Bureau, the Nevada State Demographer, and the Nevada Department of Employment, Training and Rehabilitation (DETR). The Plan uses 2040 as the horizon year for population forecasts and transportation project development.

2.1 Residential Capacity

According to the U.S. Census Bureau, the 2010 Douglas County population was 46,997, an increase of 13.9 percent over the 2000 population of 41,259. This rate of growth is in the middle range of Nevada counties, substantially less than Lyon County (50.7 percent), Clark County (41.8 percent), and Nye County (35.3 percent); and more than Elko County (7.8 percent) and Carson City (5.4 percent). Table 2.1 provides the comparative population figures for all Nevada counties from 2000 to 2010.

Table 2.1: Comparative Population Figures

STATE/COUNTY	2000 POPULATION*	2010 POPULATION**	PERCENT INCREASE (2000–2010)
State of Nevada	1,998,257	2,700,551	35.15%
Carson City	52,457	55,274	5.37%
Churchill County	23,982	24,877	3.73%
Clark County	1,375,765	1,951,269	41.83%
Douglas County	41,259	46,997	13.91%
Elko County	45,291	48,818	7.79%
Esmeralda County	971	783	-19.36%
Eureka County	1,651	1,987	20.35%
Humboldt County	16,106	16,528	2.62%
Lander County	5,794	5,775	-0.33%
Lincoln County	4,165	5,345	28.33%
Lyon County	34,501	51,980	50.66%
Mineral County	5,071	4,772	-5.90%
Nye County	32,485	43,946	35.28%
Pershing County	6,693	6,753	0.90%
Storey County	3,399	4,010	17.98%
Washoe County	339,486	421,407	24.13%
White Pine County	9,181	10,030	9.25%

Sources: * U.S. Census Bureau—April 1, 2000

** U.S. Census Bureau—April 1, 2010

2017 Douglas County Transportation Plan

As indicated above, the U.S. Census Bureau reported that the growth rate from 2000 to 2010 was 13.9 percent. This historic growth rate was also noted in the 2011 Douglas County Master Plan, Volume II, Chapter 2, Population. In 2013, the State Demographer’s Office projected that Douglas County’s population would grow at a rate of only 0.1 percent. Both estimates are below the 2.0 percent growth rate projected in the *2007 Douglas County Master Plan*.

During the 16-year period from 2000 to 2015, the County issued 4,502 single family residential building permits, 67 multi-family residential permits (for construction of 444 dwelling units), 13 duplex permits (26 dwelling units), and 178 mobile home permits. In total, 4,760 building permits were issued that resulted in the construction of 5,159 dwelling units, an average of 322 dwelling units per year during that time period. (Refer to Table 2.2.) The 2010 U.S. Census shows an average of 2.39 persons per occupied dwelling unit. Figure 2.1 summarizes the locations of existing housing in the Lake Tahoe/Carson Valley/Carson City area in 2015, while Figure 2.2 shows the split between occupied and non-occupied housing in the Carson Valley.

During the 10-year period from 2005 through 2014, overall employment within the County declined by approximately 18 percent. Of the ten industries identified in Table 2.3 *Employment by Industry*, only three had increases in employment during that time period. Those were professional and business services, education and health services, and other services. The local unemployment rate at the end of 2014 was 7.0 percent of the workforce. Figure 2.3 shows the employment locations in the Carson Valley.

Table 2.2: Annual Building Permits Issued, Dwelling Units Constructed—2000 to 2015

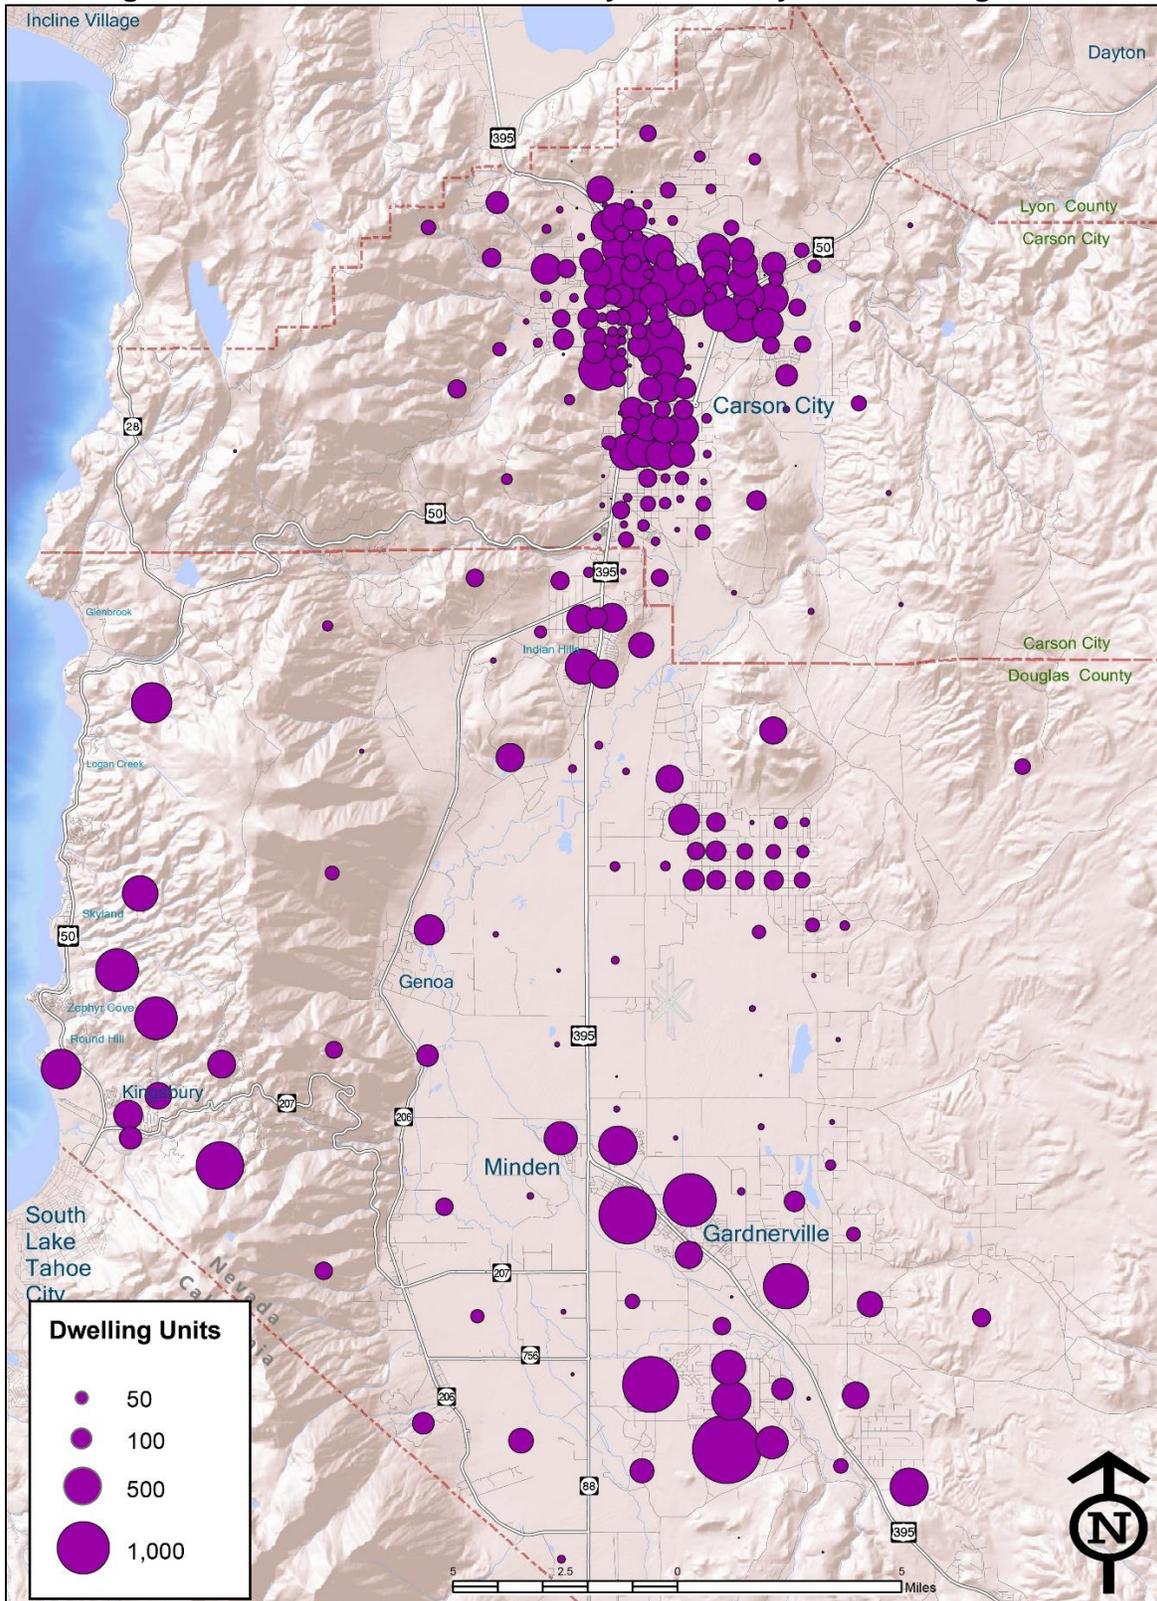

YEAR	SINGLE FAMILY RESIDENTIAL	MULTI-FAMILY RESIDENTIAL PERMITS (dwelling units)	DUPLEX PERMITS (dwelling units)	MOBILE	TOTAL ISSUED PERMITS (dwelling units)	DWELLING UNITS ALLOWED BY GROWTH ORDINANCE*

*Spike in government employment likely related to decadal hiring of temporary census workers.

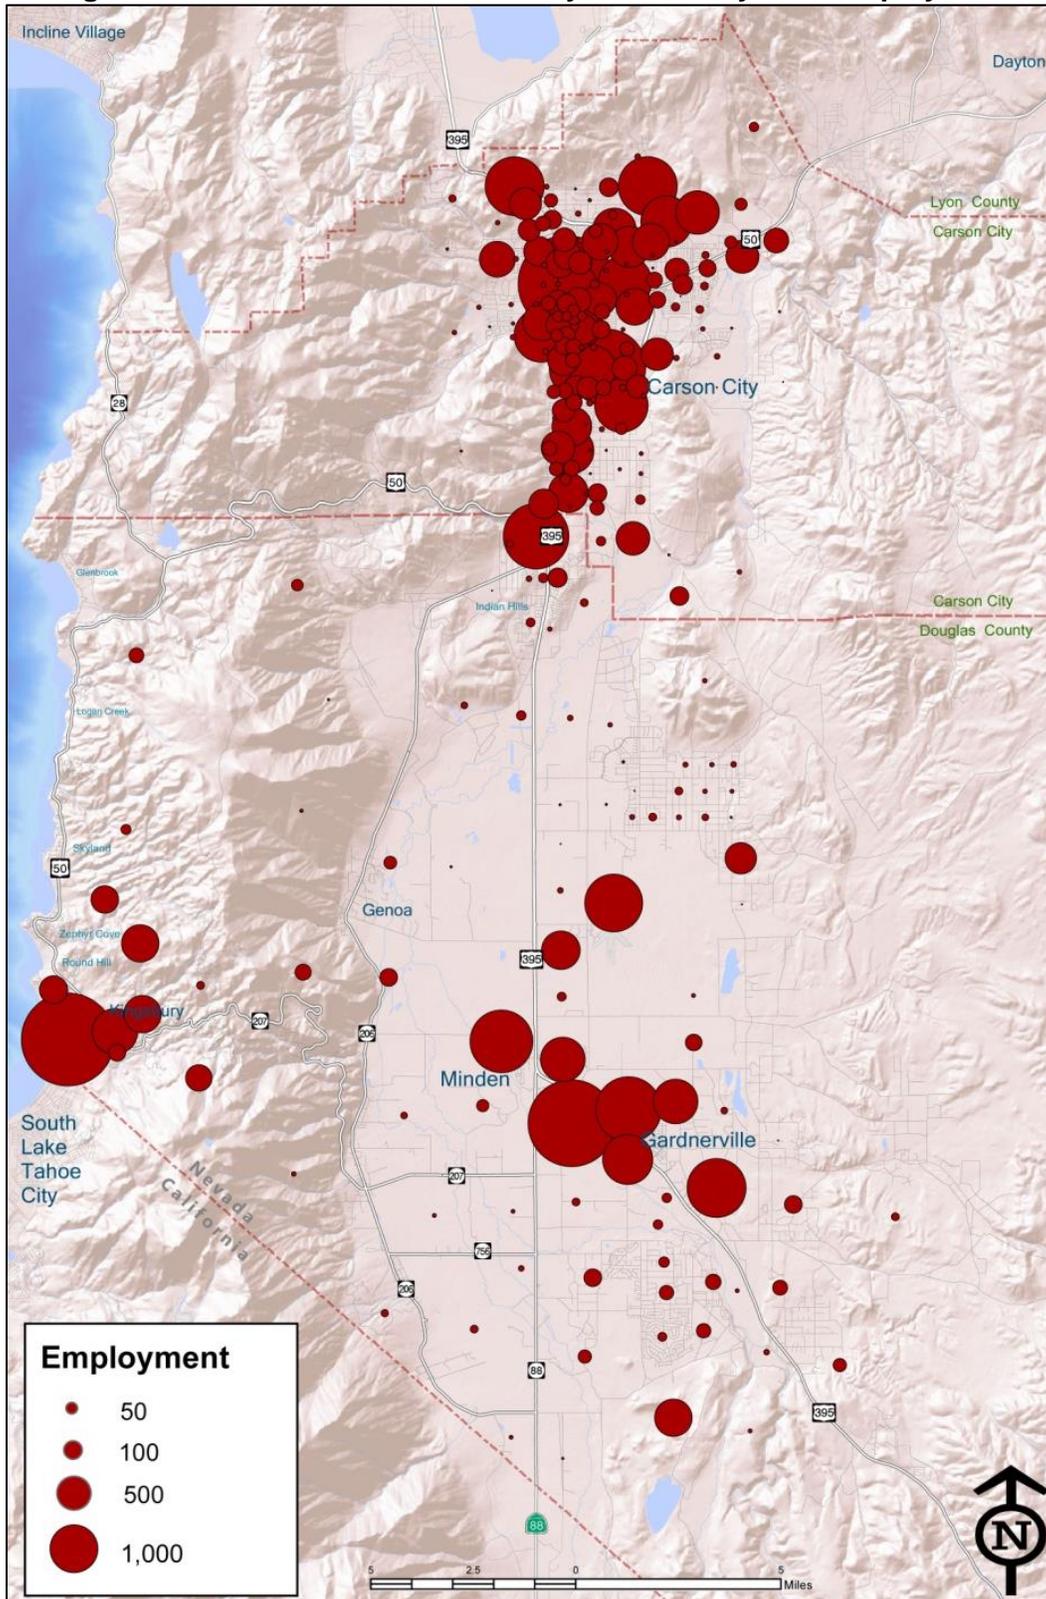

2.2 Projected Growth

The United States Census Bureau (2000), projected that the rate of growth for the state of Nevada would be higher than any other state in the U.S. between 2000 and 2030. The Bureau projected that the state would gain 2,283,845 people by 2030, reaching a population of 4,282,102. This represents an increase of 114 percent during this 30-year period. The population of Nevada was 2,700,551 in 2010. The 2010 U.S. Census does not provide a projection for the year 2040. The process of selecting a population growth rate began by considering four potential growth rates. Those growth rates were:

- Very Slow Growth = 0.1 percent (from the State Demographer’s Office, 2013)
- Slow Growth = 1.0 percent (established by Douglas County)
- Historic Growth = 1.39 percent (2010 U.S. Census data and 2011 Master Plan)
- Maximum Growth = 2.0 percent (Douglas County Title 20, Chapter 20.560).

The Nevada State Demographer’s Office, in a report dated October 2013, established the 2013 Douglas County population as 48,478. Using this population as the starting point and the above growth rates, Figure 2.4 shows population projections for Douglas County up to 2040. The impacts of these four growth rates on the transportation network were then modeled using the projected 2040 populations and the existing roadway network. The model results were then reviewed with Douglas County Community Development staff, and the Historic Growth Rate of 1.39 percent was established as the rate to be used for all subsequent modeling.

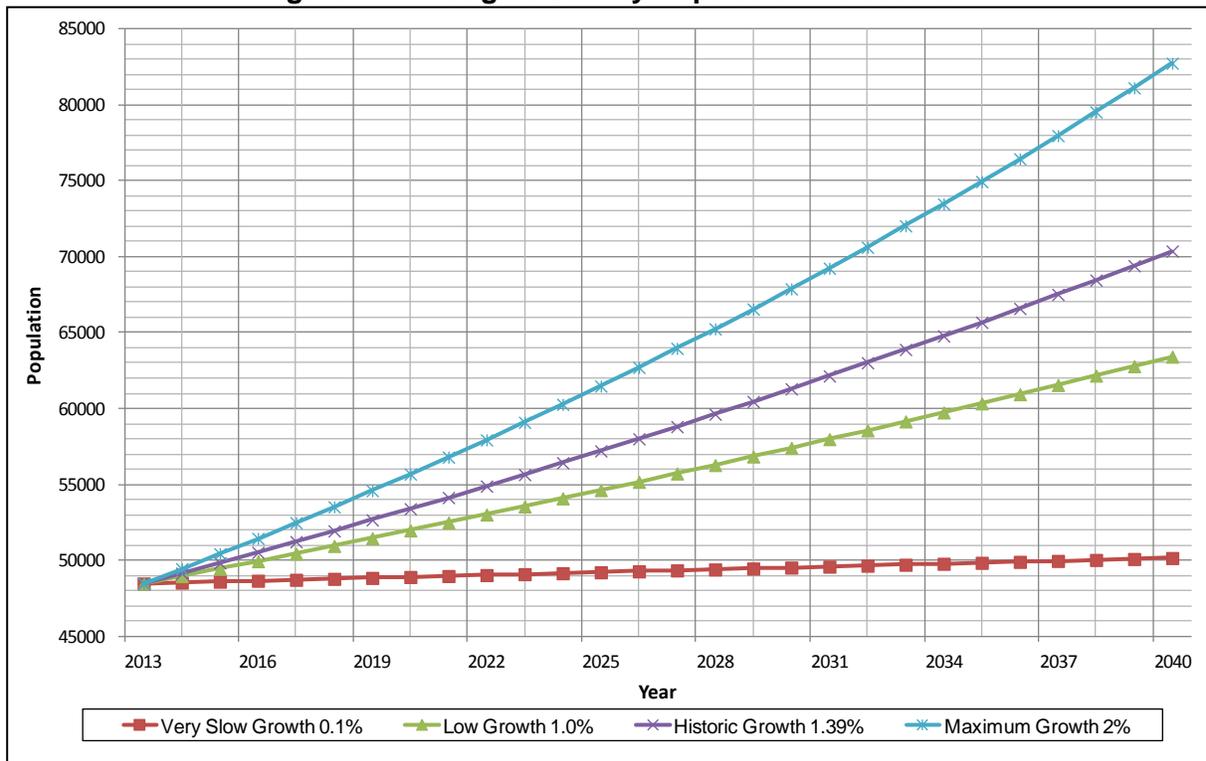

Figure 2.3: Lake Tahoe/Carson Valley/Carson City 2015 Employment

Source: 2014 Nevada Department of Employment, Training and Rehabilitation

2017 Douglas County Transportation Plan

Figure 2.4: Douglas County Population Forecasts

Source of the 2013 population of 48,478 is the Nevada State Demographer's report *Nevada County Population Projections 2014–2033*, dated October 1, 2014

Use of the Historic Growth Rate of 1.39 percent has a number of benefits compared to the previously used 2.0 percent growth rate:

- Based on past growth, it should approximate future growth more closely than the 2.0 percent growth rate used in 2007 Transportation Plan.
- It appears to be conservative in that it is higher than the rate experienced since 2010.
- For the 2040 scenario, it generates an estimated population of 70,400. This is slightly higher than the buildout population (66,803) identified in the 2011 Douglas County Master Plan Population and Housing–Technical Report based on maximum density associated with unimproved acreage. Accordingly, it anticipates that Master Plan amendments might be approved that would increase densities.

The 2040 population estimate of 70,400 is considerably lower than the estimate of 83,689 reflected in the 2007 Transportation Plan for the planning horizon year 2030. As a result, this 2017 Transportation Plan identifies fewer capacity improvement projects needed to maintain level of service standards than the 2007 Plan.

Douglas County voters approved the Sustainable Growth Initiative in November 2002, limiting the number of building permits that the county can issue to 280 per year. Implementation of

2017 Douglas County Transportation Plan

this ordinance was delayed due to legal actions at the State Supreme Court and District Court levels. In June 2007, the Douglas County Board of Commissioners approved a Growth Management Ordinance that revoked the initiative and established a two percent compounded growth rate for residential building permits over the next 50 years. The ordinance allows Douglas County to issue up to a maximum of 386 residential building permits in 2017 and up to 609 permits in 2040. However, the actual number of permits issued since the Growth Management Ordinance went into effect in 2007 has been well below the maximum allowed. Refer to Table 2.2, Annual Residential Permits Issued—2000 to 2015.

A travel forecast model is the tool commonly used to determine future traffic levels on the street system. For the purpose of the *2017 Douglas County Transportation Plan*, the travel forecast model developed for the 2007 Transportation Plan has been updated to reflect the current population, employment and highway network information for Carson City and Douglas County.

The updated travel forecast model includes both Douglas County and Carson City because these counties are connected geographically and economically. The residential and commercial growth in one area affects the growth and development of the adjacent area as people constantly travel between counties for housing, employment, health care and recreation. Table 2.4 shows the residential and employment data for 2014 and projections for 2040 that are used in the model. The table provides a summary of planning variables used in the model for the Douglas County portion of the two-county model.

Table 2.4: Douglas County Land Use/Employment Data Traffic Forecast Model—2014 to 2040

	DOUGLAS COUNTY LAND USE DATA					
	2014 MODEL*	2025 HISTORIC GROWTH**	2040 HISTORIC GROWTH**	2040 VERY SLOW GROWTH**	2040 LOW GROWTH**	2040 MAXIMUM GROWTH**

** Growth rates applied to Nevada State Demographer 2013 data.

2017 Douglas County Transportation Plan

The Douglas County travel demand model reflects a 55.9 percent growth in employment from 2013 to 2040. Table 2.4 depicts employment by model category as the number of employees increase from 19,761 to 30,812. While the Nevada DETR reports an employment count of 17,954 non-farm jobs within Douglas County for 2014 (Table 2.3), 19,761 jobs were located geographically (based on the midpoint of employer specific count ranges), and assigned to a traffic analysis zone for traffic modeling purposes.

The following assumptions are included in the travel forecast model:

- Employment in Douglas County is expected to increase, in spite of the declining trend observed from 2005 to 2014.
- Population and employment growth has been distributed to traffic analysis zones based on the Master Plan land use designations in effect in 2015. Population growth has been distributed primarily to the receiving areas, while employment growth has been distributed to known areas of existing or planned employment.
- The travel model includes the housing developments approved by Douglas County and listed in Table 2.5 as projects with vesting for the administration of Building Permit Allocation and Growth Management Ordinance. The travel model also includes the future development associated with the North Douglas County Specific Plan identified in Table 2.6, Approved Specific Plans.

Most of the residential growth in the County is expected to be located in the Minden/Gardnerville area, generally bounded by Johnson Lane on the north, East Valley Road on the east, the Gardnerville Ranchos to the south, and SR 88 and U.S. 395 north of Buckeye Road on the west. Table 2.5 provides a list of tentatively approved subdivisions county-wide. The building permit allocations identified in the table are built into the travel demand model as future residential units for the years 2025 and 2040. These future units are reflected on Figure 2.5 which illustrates the projected residential growth in Carson Valley from 2010 to 2040.

Figure 2.6 illustrates the projected employment growth in Carson Valley from 2010 to 2040. The majority of the projected employment growth occurs in and around the Minden/Gardnerville area, including the area around the Minden–Tahoe Airport. A minor amount of new commercial development is projected for the area south of Gardnerville along U.S. 395. Additional commercial developments are planned for the northern most part of the county along U.S. 395.

2.3 Commute Patterns within Douglas County and Carson City

There is a fairly even balance between Douglas County in-commuting and out-commuting. The 2010 U.S. Census “Journey to Work” report data shows 7,528 commuters leaving Douglas County for work and 7,854 commuters coming into Douglas County for work. The largest numbers of out-commuters (4,394) travel to Carson City. The largest numbers of in-commuters (4,046) travel from El Dorado County, primarily to work for employers in the Lake Tahoe area.

Source: Douglas County Community Development Department

Carson City had 12,559 commuters enter from other counties, most significantly Douglas County (4,394), Lyon County (4,013) and Washoe County (3,576). There were 5,376 Carson City residents who left the county for work. Of these, 2,318 commuters went to Washoe County and 2,097 residents traveled to Douglas County.

Tables 2.7 and 2.8 provide a detailed breakdown of the commute patterns within Douglas County and Carson City as taken from the U.S. census data. These commute patterns indicate that a substantial amount of employment related travel occurs between Douglas County, Carson City and Washoe County. Due to the land use patterns and the limited number of parallel routes, much of this traffic is funneled through the U.S. 395 corridor.

U.S. census data within Douglas County and Carson City provide information on the mode of travel to work. Table 2.9 provides separate totals of modes of travel to work for Nevada, Douglas County, Carson City, and the two counties combined. The ratios of each transportation mode for the two counties are similar to the state averages in almost all categories. The main exception is the category of public transit, where Douglas County and Carson City average 0.8 percent use compared to the statewide average of 3.8 percent. The main users of the transit service in the study area are the elderly and persons with disabilities. Due to the rural nature of this area, transit service is not geared toward transporting working persons. Since the 2000 U.S. Census, Jump Around Carson has provided regular transit service in Carson City, which should increase the percentage of public transit use in the area.

Two interesting statistics emerge from Table 2.9: (1) 13 percent of the work trips involve a two-or-more person carpool and (2) 3.4 percent of the work trips are made by walking or bicycling. This data indicates that a significant number of commuters are already using alternatives to the single-occupant vehicle, with minimal marketing or external incentive.

Table 2.10 provides detailed information on travel times to work within the state of Nevada, Douglas County and Carson City. The greatest share of commuters (25 percent) in the study area travel between 10 and 14 minutes to work, with most commuters (89 percent) traveling between 5 and 44 minutes. Figure 2.7 illustrates that Douglas County and Carson City share a similar commute pattern, with a 5 to 10 minute shorter commute than the statewide average, which is heavily influenced by Clark County travel patterns.

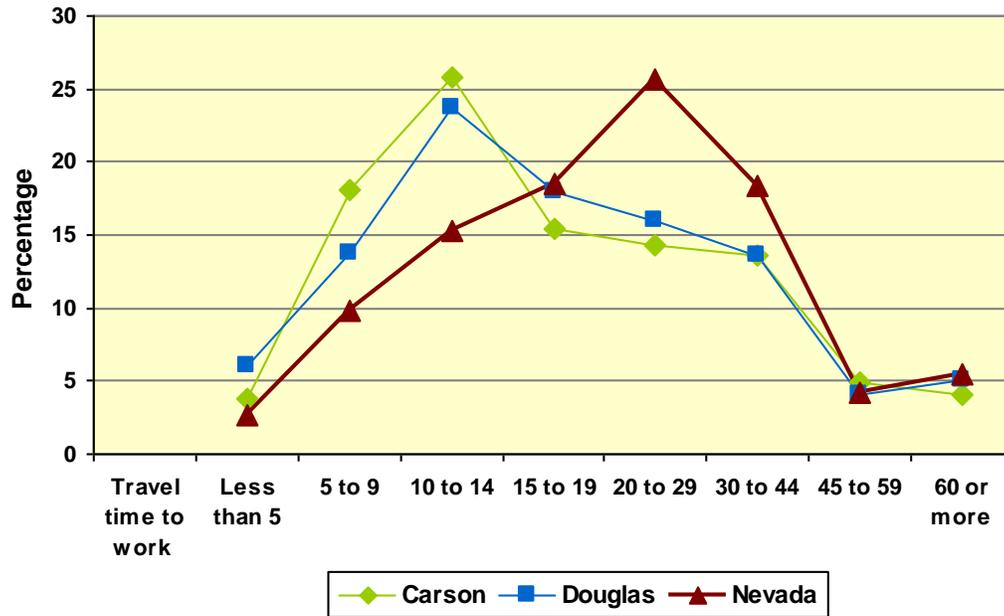

Chapter 3 provides a more extensive discussion of the travel forecast model and its use in developing the transportation system reflected in the Transportation Plan.

Table 2.10: Travel Time to Work (workers who did not work at home)

2.4 Growth Policies

- 2.4.1 Evaluate the impacts of current and planned development in Douglas County.
- 2.4.2 Coordinate transportation planning and land use development.

**Chapter 3****DOUGLAS COUNTY/CARSON CITY TRAVEL DEMAND MODEL**

Transportation policy makers rely on travel analysis tools to evaluate the impacts of land use development and the need for infrastructure improvements. A travel demand model is one of the key technical analysis tools used for this evaluation. It uses a complex computer program to provide answers to “what if” questions about the effects of proposed development and land use policies. The model predicts travel behavior and travel demand within a specific area, over a particular time period.

3.1 How Travel Demand Modeling Works

A travel demand model uses a four-step process to create a simulation of current and future travel demands.

- Step 1. Trip generation (how many trips will people make?)
- Step 2. Trip distribution (where will people start and end their trips?)
- Step 3. Mode choice (which methods will people use to travel?)
- Step 4. Trip assignment (what routes will people take?)

To account for land use development, the study area is broken into individual traffic analysis zones, which are assigned a specific number of origin and destination trips based on such factors as residential, employment and retail activities. Once the travel model is developed, transportation planners can create a simulation of existing travel patterns. The model is then checked or “validated” to ensure that the assumptions are correct. When the model is sufficiently calibrated to accurately account for current travel patterns, it can be used to forecast future travel based on proposed changes to the land use or infrastructure.

For example, when a new residential development is proposed, the model can predict the number of people who will travel on local and regional streets to reach their school, shopping, recreation and/or employment destinations. If a specific roadway is added to the existing network, or an existing road is widened, the model predicts how many trips will travel on the newly improved facility. In this way, transportation improvements can be designed and constructed to coordinate with the needs of the new development.

3.2 Overview of the Douglas County/Carson City Model

The Douglas County/Carson City travel demand model is designed to operate with TransCAD[®] software, which is used by the Nevada Department of Transportation (NDOT) for planning projects throughout the state. The detailed description of the modeling assumptions and analysis is available in a separate document, allowing Douglas County and NDOT model users to revise the model for future project analysis.

To provide a more accurate evaluation of travel patterns, the model encompasses transportation patterns in both Douglas County and Carson City. In addition to reflecting the regional nature of travel in these two counties, the shared model provides an opportunity for assisting policy makers with coordinating proposed land use and transportation improvements.

The travel demand model divides the two-county area into 324 internal traffic analysis zones and seven external traffic analysis zones for travel forecasting purposes. Figure 3.1 illustrates these boundaries on a map of the two counties. To increase model accuracy, traffic analysis zones that are located in urban areas have a smaller geographical area than those located in rural areas.

Some of the trips begin or end outside of the model area. These trips are assigned to locations where roads leave the county, called “external gateways.” Table 3.1 lists the locations of the external gateways used in the model.

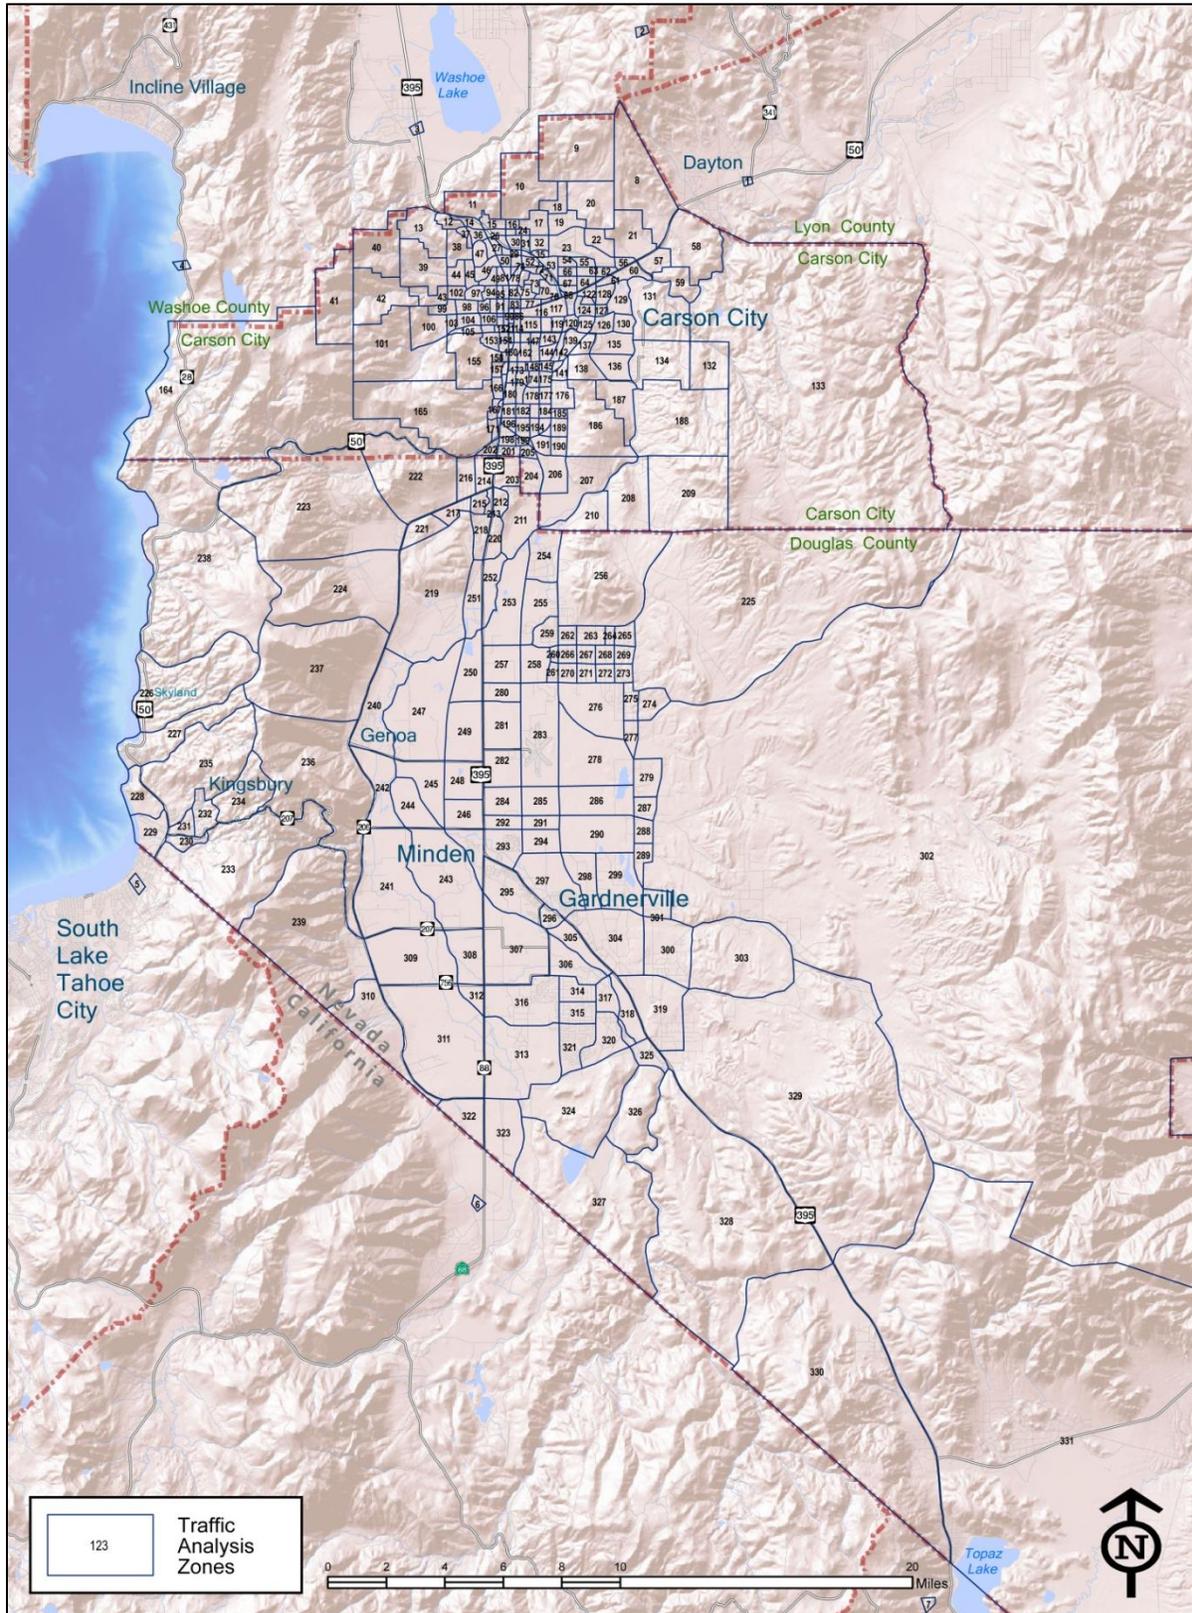

The model identifies the streets and highways that people use for travel. Appendix A, the Travel Demand Model, Figure 3.1 shows the 2014 Base Highway Network with the streets identified according to their functional classification (see Chapter 4 for more detail on the classification system). This network contains all major streets in the study area and their characteristics, such as the number of lanes and the historical traffic counts. Because of the technical requirements of the travel demand model, this map shows a slightly different functional classification network than the Douglas County map.

3.3 Forecasting in the 2017 Douglas County Transportation Plan

The Douglas County/Carson City travel demand model is a new and improved version of the travel forecasting models and model components previously developed for Douglas County and Carson City. To develop an accurate database for the model development, staff obtained residential data from the Douglas County Assessor’s office and employment data from the Nevada Department of Employment, Training and Rehabilitation. Median income data was obtained from the 2000 census data at the block group level and was appropriately distributed at the traffic analysis zone level. All data was adjusted for the model base year 2014.

[®] TransCAD is a registered trademark of Caliper Corporation.

Figure 3.1: Douglas County and Carson City Traffic Analysis Zone Map

2017 Douglas County Transportation Plan

Table 3.1: External Gateways in the Travel Demand Model

GATEWAY/TAZ NO.	ROADWAY	LOCATION
1	U.S. 50	East end of Carson City
2	Goni Road	North end of Carson City
3	U.S. 395	North end of Carson City
4	State Route 28	West end of Carson City
5	U.S. 50	West end of Carson City
6	State Route 88	South end of Douglas County
7	U.S. 395	South end of Douglas County

Comparing the model results with actual traffic counts on the roadways indicated that the model was operating very accurately. This “model validation” took place using traffic counts at 69 locations in Douglas County and 103 locations in Carson City. The comparison was made for morning peak, evening peak, off-peak and daily traffic volumes. These were a combination of 2014 Nevada Department of Transportation counts and 2015 counts by Parsons. The counts showed an overall total deviation between the travel model and the actual traffic counts of three percent for morning peak travel, eight percent for evening peak travel, two percent for the off-peak travel and three percent for the daily travel. These variations are considered within allowable tolerances for planning purposes as described in Appendix A, Douglas County/Carson City Travel Demand Model report.

After validating the model for the base year 2014, Parsons ran the traffic model for the years 2025 and 2040 to determine the transportation system needs in the future. Please see Appendix A, *Douglas County/Carson City Travel Demand Model*, for a complete documentation of the travel demand model.

3.4 Travel Demand Model Policies

- 3.4.1 Update the travel demand on a regular basis, at least every ten years.
- 3.4.2 Maintain accurate data on population, employment and average daily traffic to facilitate travel model update.

2017 Douglas County Transportation Plan

Chapter 4 STREETS AND HIGHWAYS

The Streets and Highways section provides a detailed discussion of the existing and proposed transportation network. This section explains the methods used for quantifying the transportation network, including traffic counts on Douglas County streets and highways, classification of streets into arterials, collectors and roadways, and methods for determining the traffic level of service. The section also discusses the major roadway issues in Douglas County, along with specific policies to maintain and improve the transportation network. This section includes three lists of projects. These lists are sorted by timeframe and need: (a) projects needed by 2025 to maintain LOS C on County roads and LOS D on Nevada Department of Transportation (NDOT) roads, (b) projects needed by 2040 to maintain LOS C on County roads and LOS D on NDOT roads, and (c) projects that provide alternate local and regional access.

4.1 Assessment of Existing Conditions

4.1.1 FUNCTIONAL CLASSIFICATION

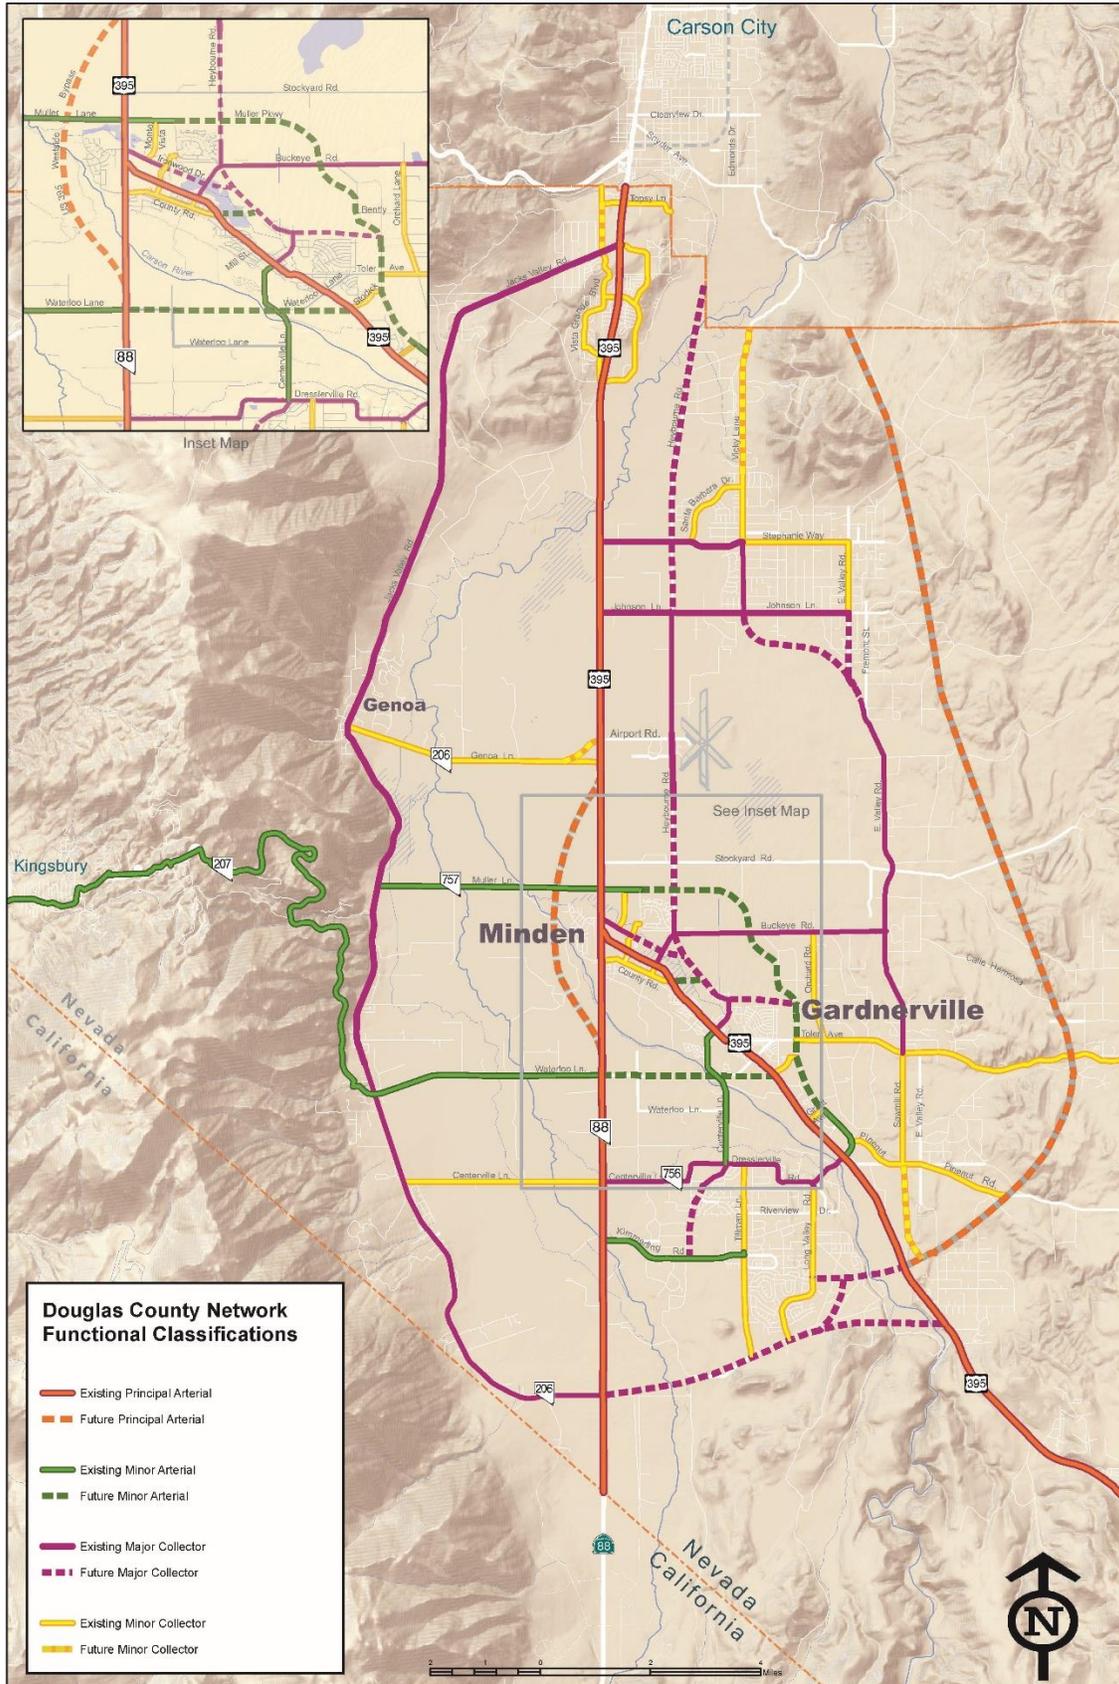

The first step in developing the transportation plan is to assess the condition of the existing street and highway network. Roadways are classified by the character of service they provide. Grouping types of roads based on their function allows for the development of road standards to meet travelers' mobility requirements. A brief discussion of the *Douglas County Engineering Design Criteria and Improvement Standards Manual* is included at the end of this section. A complete version of this document is available on the Douglas County website. To account for the technical requirements of the travel model, the roadway functional classification utilized in the model is slightly different from the highway network map shown on Figure 4.1. The following functional classification definitions are consistent with those adopted by the Nevada Department of Transportation (NDOT) in conformance with the United States Federal Aid Highway Law.

Principal Arterials

The rural principal arterial system consists of a connected rural network of continuous routes which serve corridor movements having trip lengths and travel density characteristics indicative of substantial state-wide or interstate travel. In addition, the rural principal arterial system serves essentially all urban areas with a population of 50,000 and over, and the majority of those with populations of 25,000 and over. The rural arterial system provides an integrated network without stub connections except where unusual geographic or traffic flow conditions dictate otherwise.

The rural principal arterial system is classified into the interstate system and other principal arterials. Within Douglas County, there are no roadways that are part of the interstate system, but there are several state highways that have been classified as other principal arterials. These roadways include U.S. 50, U.S. 395, State Route (SR) 28, SR 208, and SR 88. All of these roadways are maintained under the jurisdiction of NDOT.

Figure 4.1: Roadway Functional Classification Map

2017 Douglas County Transportation Plan

Minor Arterials

The minor arterial street system interconnects with and augments the principal arterial system and provides service to trips of moderate length at a somewhat lower level of travel ability than the principal arterials. In addition, this system distributes travel to geographic areas smaller than those identified within the principal arterial system. Minor arterial street systems include all arterials not classified as principal and contain facilities that place more emphasis on land access than the principal arterial system. Minor arterial systems typically carry local bus routes and provide inter-community continuity, but ideally do not penetrate identifiable neighborhoods. The minor arterial street system includes urban connections to rural collector roads where such connections have not been classified as principal arterials.

Rural/Urban Major Collector

The rural/urban major collector system provides service to any central business district not on an arterial route, and into the larger towns not directly served by higher systems. In addition, major collector roads provide service to traffic generators of equivalent intra-county importance such as consolidated schools, county parks, important mining areas, etc. The rural/urban major collector roads link these places with nearby larger towns or cities or with routes of higher classifications. Rural/urban major collector roads serve the more important intra-county travel corridors.

Rural/Urban Minor Collectors

The rural/urban minor collector roadways are laid out consistent with population density in order to collect traffic from local roads and bring all developed areas within a reasonable distance of the collector road. In addition, they provide service to the remaining smaller communities and link locally important traffic generators within their rural areas.

Rural/Urban Local Roadway

The local street system comprises all facilities not on one of the higher systems. The local roadway system provides direct access to abutting land and access to higher order systems.

Figure 4.1 shows the Roadway Functional Classification for streets and highways as determined by the Douglas County Community Development Department. Rural and urban local streets and roads are not illustrated on this graphic.

4.1.2 EXISTING TRAFFIC LEVELS

The second step in developing the transportation plan is to inventory the volume of traffic using the existing transportation network. To undertake this inventory, data was collected from NDOT and field counts were taken at 26 road segments in Douglas County and Carson City during 2015. These traffic volume counts were taken 24 hours per day for a period of seven days. Peak hour traffic counts were also taken at 10 intersections as directed by County staff.

2017 Douglas County Transportation Plan

Tables 4.1 and 4.2 provide a.m. and p.m. peak hour traffic data along certain Douglas County road segments. The tables allow for traffic flow in two possible directions: north-south **OR** east-west. When reading the tables, one must first determine the directional orientation of the road. On a north/south oriented road, the left column provides information for the northbound direction and the right column provides the southbound traffic data. On a roadway with an east/west orientation, the left column provides data for the eastbound traffic; the right column provides data for the westbound traffic.

Table 4.3 shows historical trends of average daily traffic on selected county roadways from 2005 to 2014. Traffic during this period has generally decreased, with traffic volumes at a few locations remaining nearly unchanged.

4.1.3 QUANTITATIVE EVALUATION/LEVEL OF SERVICE

Level of service (LOS) is the term used by traffic engineers to explain how effectively a roadway segment or intersection is operating as perceived by the transportation system user. Similar to the grading system used in schools where “A” is the best and “F” is the worst, the six traffic levels of service range from LOS A (high speed and high residual capacity with minimal delay) to LOS F (low speed and no residual capacity with high levels of delay). Figure 4.2 illustrates levels of service at an urban intersection and Table 4.4 describes the conditions experienced at different levels of service at signalized intersections.

Existing traffic levels of service for Douglas County’s streets and highways were determined by comparing daily traffic volumes to typical roadway capacities. The vehicle volume to roadway capacity compares roadway demand (vehicle volumes) with roadway supply (carrying capacity). This measure can alert transportation planners to areas where traffic mitigation measures should be considered. Volume to roadway capacity is often associated with determining the traffic level of service. While the levels of service may be estimated based on daily volumes and capacities, the ratings refer to peak hours of the day (typically morning and evening commute hours). During other hours, better levels of service would prevail.

Table 4.2 lists the traffic level of service and the vehicle volume-to-capacity ratio observed for the street segments which were counted for both morning and evening peak hours.

The roadway improvements described in this transportation plan are designed to maintain LOS C or better on all County-maintained roads, and LOS D or better on roads maintained by the Nevada Department of Transportation.

Figure 4.2: Traffic Level of Service Illustration

Source: City of San Jose

Table 4.4: Level of Service Definitions

LOS	SIGNALIZED INTERSECTION	UNSIGNALIZED INTERSECTION	ROADWAY (DAILY)
A	Uncongested operations; all queues clear in a single signal cycle. <i>Average Delay < 5 sec</i>	Little or no delay. 0 to 4 second average delay	Free flow
B	Uncongested operations; all queues clear in a single cycle. <i>Average Delay 5 < 15 sec</i>	Short traffic delays. 5 to 9 second average delay	Free flow, presence of other vehicles noticeable.
C	Light congestion, occasional backups on critical approaches. <i>Average Delay 15 < 25 sec</i>	Average traffic delays. 10 to 19 seconds average delay	Ability to maneuver and select operating speed affected.
D	Significant congestions of critical approaches, but intersection functional. Cars must wait more than one cycle during short peaks. No long queues formed. <i>Average Delay 25 < 40 sec</i>	Long traffic delays. 20 to 29 seconds average delay	Unstable flow, speeds and ability to maneuver restricted.
E	Severe congestion; long queues on critical approaches. Blockage of intersection if no protected turning movements. Traffic queue may block nearby intersections upstream of critical approaches. <i>Average Delay 40 < 60 sec</i>	Very long traffic delays, failure, extreme congestion. More than 30 seconds average delay	At or near capacity, flow quite unstable.
F	Total breakdown, stop-and-go operation. <i>Average Delay > 60 sec</i>	Intersection blocked by external causes.	Forced flow, breakdown.

2017 Douglas County Transportation Plan

Table 4.5 compares Douglas County’s threshold volumes for LOS A through LOS E with the Florida Department of Transportation, a widely used reference, and Parsons’ standard for rural areas that are transitioning into urban areas. This table is used to evaluate the future level of service on roadways with different functional classifications. Generally, the Douglas County threshold is a slightly lower number than the other standards, resulting in facilities being rated at a lower level of service than similar facilities in other areas with the same traffic volume. This differential is only minor, indicating that Douglas County’s level of service threshold volumes are appropriate for this area.

Table 4.5: Level of Service Threshold Volumes Comparison of Methodologies

ROADWAY TYPE		MAXIMUM TOTAL DAILY VEHICLES IN BOTH DIRECTIONS (ADT)

 ¶ Non-state roadways in Florida

2017 Douglas County Transportation Plan

For example, a 4-lane minor arterial reaches the Douglas County level of service maximum of LOS C at 21,000 ADT. For the same type of facility, Parsons recommends a 28,800 vehicle maximum and the Florida Department of Transportation allows a maximum of 22,700 vehicles. Douglas County has a stricter designation of what constitutes a significant level of delay caused by traffic than the comparison areas. The travel demand model and ADT volumes indicate that all of the County-maintained roadways are currently operating at LOS B or better during peak times, except Riverview Drive and Stephanie Way from U.S. 395 to South Santa Barbara Drive, which are operating at LOS C. All of the NDOT-maintained roads are currently operating at LOS D or better, except U.S. 395 from Mica Drive to I-580 in Carson City which is operating at LOS F, and U.S. 395 from Muller Parkway to SR 88, which is operating at LOS E.

The 2014 level of service thresholds, shown in **bold** text in Table 4.5, are the thresholds used in the Douglas County/Carson City Travel Demand Model to evaluate the level of service for Douglas County based on the functional classifications established by the County and shown on Figure 4.1.

4.1.4 EXISTING PERFORMANCE AND NEAR-TERM CHALLENGES

At the current time, a significant transportation issue in Douglas County is the concern about traffic safety and capacity along the U.S. 395 corridor through the towns of Gardnerville and Minden. U.S. 395 is the primary corridor through Carson Valley, with a limited number of parallel roads that could absorb any through traffic. In addition, U.S. 395 transitions into historic Main Street through the towns of Gardnerville and Minden, where many local commercial and retail businesses front on the highway. People and vehicles accessing those businesses have conflicts with the motorists who want to travel through these commercial areas as quickly as possible. Another consequence of through traffic being funneled onto U.S. 395/Main Street is that pedestrians and bicyclists have difficulty crossing the highway safely.

In 2007, NDOT completed the *U.S. 395 Southern Sierra Corridor Study*, which considers many of these issues. The study recommends working closely with Douglas County to implement roadway safety and capacity improvement projects.

Douglas County grew steadily from 1990 through 2005. Since that time, growth has slowed considerably, but has recently begun to accelerate. (Refer to Table 2.2, Annual Residential Permits Issued, Dwelling Units Constructed.) The existing transportation infrastructure has been able to cope with the effects of this growth, preserving acceptable traffic flow (LOS C on Douglas County facilities, LOS D on NDOT facilities) on most roadways.

2017 Douglas County Transportation Plan

Under existing road network and traffic conditions, the travel demand model and ADT volumes indicate that two road segments are currently experiencing level of service (LOS) deficiencies:

Existing LOS Deficiencies with Existing Road Network (no projects)

Road Segment	LOS
U.S. 395 from U.S. 50 to Mica Drive	F
U.S. 395 Muller Lane to SR 88	E

Given the magnitude of the projects needed address these LOS deficiencies, it is virtually impossible that they can be addressed in the short-term. Accordingly, the projects needed to address these deficiencies are included in the list of project for completion by 2025. Nevertheless, it should be noted that the County’s 2017 5-Year Transportation Plan indicates that Buckeye Road is planned to be connected to U.S. 395 north of Minden via Heybourne Road and Muller Parkway no later than 2017. Although this connection is not anticipated to improve the LOS on U.S. 395 from Muller Lane to SR 88, it will provide an alternate route for some drivers.

4.2 Vision/Guiding Policies and Principles

The 2007 Douglas County Transportation Plan identified the following policies:

- 4.2.1 *Identify high accident locations and take appropriate actions to ensure continued public health and safety.*
- 4.2.2 *Provide appropriate traffic control devices on new and existing transportation facilities.*
- 4.2.3 *Protect public safety by removing snow and other hazards from roadways.*
- 4.2.4 *Post appropriate speed limits based on current speed limit studies.*
- 4.2.5 *Remove litter, trash and debris from the roadside and the right-of-way to keep roadways within Douglas County aesthetically pleasant.*
- 4.2.6 *Implement selected near-term traffic safety and traffic operations improvements from 2017 to 2020.*
- 4.2.7 *Implement mid-term road improvements to provide acceptable traffic operations from 2017 to 2025.*
- 4.2.8 *Implement long-term road improvements to provide capacity and mobility from 2026 to 2040.*
- 4.2.9 *Maintain a traffic level of service “D” on all NDOT roads within Douglas County, consistent with NDOT standards.*
- 4.2.10 *Develop a “pedestrian-friendly” U.S. 395/Main Street corridor through Minden and Gardnerville. (See Complete Streets Policy dated January 19, 2016.)*

2017 Douglas County Transportation Plan

- 4.2.11 *Support NDOT projects that maintain traffic flow (high speed and capacity) on U.S. 395 between Minden and Carson City, as identified in the U.S. 395 Southern Sierra Corridor Study (2007).*

Douglas County and the Carson Valley are closely tied with the Carson City area, and U.S. 395 is the main travel corridor connecting these two areas. It will be necessary to make improvements to this highway as new development creates additional trips. In addition, it may be necessary to construct grade-separated interchanges at specific locations.

- 4.2.12 *Support possible bypass facilities to keep traffic moving through Minden and Gardnerville.*

The U.S. 395/Main Street corridor is important to the vitality and the sense of community in Douglas County. As the largest towns in the county, Minden and Gardnerville have a strong desire to preserve their identity and character. Local residents developed the *Minden Plan for Prosperity* (2003) and the *Gardnerville Plan for Prosperity* (2006) along with *Design Guidelines* to address their most important issues. The plans made the following recommendations:

- Provide traffic signals at selected intersections to allow pedestrian crossings of U.S. 395.
- Provide medians and crosswalks to facilitate pedestrian and bicycle connections.
- Use traffic calming devices to slow traffic through towns for safe access to local businesses.
- Improve the image of U.S. 395 by creating walkable streetscapes.

Construct the following projects (if needed):

- In the north part of Minden, west of U.S. 395, near the intersection with SR 88, construct a connection from U.S. 395 to SR 88 which bypasses the existing Ironwood development and the Douglas High School.
- On SR 88, from the bypass of the Ironwood/Douglas High School area to Kimmerling Road and the extension of Dressler Lane from SR 88 to U.S. 395, increase capacity from two lanes to four lanes.
- In the south part of Carson Valley, south of Dresslerville, from U.S. 395 to SR 88, construct a two-lane collector generally running in an east-west direction as an extension of Dressler Lane.
- Other projects identified by NDOT to provide highway bypass facilities consistent with the guiding principles stated in this section.

- 4.2.13 *Develop a truck routes plan to keep excessive through traffic out of neighborhoods.*

Current truck levels are not excessive in Douglas County; however, the county needs to plan for future growth in the area.

2017 Douglas County Transportation Plan

County Code Title 10 Vehicles and Traffic, Section 10.08 Control Devices has recently been updated to more clearly address truck traffic restrictions in Douglas County. Refer to 10.08.040 Vehicle restrictions on highways or streets, and 10.08.050 Vehicle restriction exceptions, both updated in 2016. Also refer to 10.08.020 Placement of traffic control devices in general improvement districts.

4.2.14 *Resolve/prevent neighborhood traffic issues by providing adequate through traffic facilities on major collectors and arterials.*

As the levels of traffic increase, there are more conflicts between vehicles and neighborhood residential uses. Arterial and collector streets should be designed to provide sufficient capacity to reduce through traffic on local streets. Traffic calming measures may be employed in a supporting role where required.

The fundamental challenge is to develop an adequate county-wide transportation network that will service traffic needs within the Minden/Gardnerville area and will provide adequate traffic capacity for movement to the Carson City area. Douglas County will continue to explore ways to provide north–south and east–west collectors and arterials, including providing additional capacity on Heybourne Road, Vicky Lane, Stephanie Way and Johnson Lane.

In 2025 with the existing roadway network (i.e., without construction of Muller Parkway), U.S. Highway 395 is anticipated to experience localized LOS failures in the downtown area and from SR 88 north to Muller Parkway. Completion of a two-lane Muller Parkway from Pinenut Road with a posted speed limit of 45 mph (the design speed) provides a very attractive alternative to U.S. 395 through the downtown area. These improvements result in acceptable LOS on U.S. 395 but LOS E and F on Muller Parkway from Toler Lane to Heybourne Road. Accordingly a 4-lane Muller is recommended for construction by 2025.

4.2.15 *Provide traffic transitional facilities (such as traffic circles/roundabouts) in the Minden/Gardnerville area.*

4.2.16 *Maintain a current map of proposed Douglas County transportation improvement projects.*

4.2.17 *Maintain current design standards for Douglas County roadway classifications as identified in the Douglas County Design Criteria and Improvement Standards Manual.*

4.2.18 *Maintain a level of service “C” or better on all Douglas County streets and roadways.*

The 1996 Douglas County Master Plan and the 2007 Transportation Plan stated that the minimum standard for the county road network is LOS C, which indicates stable-flowing traffic with acceptable delays. The 2014 and 2015 traffic counts and the travel demand model indicate that the current level of service is C or better on all

2017 Douglas County Transportation Plan

County-maintained streets and highways in Douglas County. Constructing the capacity-increasing projects identified in Tables 4.7 and 4.8 will keep the traffic level of service from falling below LOS C on County-maintained roads.

4.2.19 *Provide transitional facilities between higher and lower classes of roadway functional types.*

As roadway facilities are improved or developed in Douglas County, transitions are needed between higher capacity, higher speed facilities and lower capacity, lower speed facilities. In Minden, for example, a transition is needed between the north-south alignment of U.S. 395, which is currently a four-lane divided highway functioning much like a freeway, and the northwest-southeast alignment of U.S. 395 through Minden and Gardnerville. Traffic signals may be installed as an interim traffic control device.

It could be beneficial to install a traffic circle/roundabout at the intersection of Muller Lane and U.S. 395 at some point in the future. These types of transitional facilities are more effective than traffic signals when used in areas where the traffic volumes are greater than what a traffic signal would typically accommodate. Traffic is able to move through this type of facility more quickly and with fewer accidents than a conventional signalized intersection, while also serving as a transition between higher and lower speed facilities.

4.3 Transportation Capital Improvement Projects

The existing transportation plan has guided infrastructure improvement since 2007. The *2017 Douglas County Transportation Plan* lists the street and highway projects needed to accommodate planned growth in Douglas County up to the year 2040. These projects are identified in Tables 4.7 and 4.8. These projects have been incorporated into the travel demand model to determine the phasing necessary to maintain LOS standards. The travel demand model indicates that by completing these projects, the travel network will be able to accommodate the estimated traffic volumes in 2025 and 2040 and maintain traffic level of service C on Douglas County roadways, and LOS D on NDOT roadways. The county can then adopt projects from Plan into the Douglas County 5-Year Transportation Plan.

2017 Douglas County Transportation Plan

4.4 Near-Term Improvement Projects identified in the *U.S. 395 Southern Sierra Corridor Study (2007)*

System-wide transportation improvements are generally quite expensive, costing millions of dollars and often taking 10 to 20 years to complete. By contrast, near-term safety improvements can improve traffic safety and operations at a substantially lower cost and with a quicker implementation schedule. This report section contains projects that were listed in previous documents—the *U.S. 395 Southern Sierra Corridor Study (2007)* and the *2007 Douglas County Transportation Plan*.

Simultaneous with developing the *2007 Douglas County Transportation Plan*, Parsons prepared the *U.S. 395 Southern Sierra Corridor Study* for the NDOT. A significant part of the study was the 2007 public outreach effort, known as the traffic safety charrette, which generated numerous near-term safety recommendations for specific projects within the U.S. 395 corridor and at selected intersections. The corridor study recommended implementing these safety improvements within three to five years. NDOT representatives provided the cost and schedule estimates in 2006. The estimated project schedule is effective from the date of NDOT approval and funding.

Table 4.6 summarizes the near term recommendations from 2007 that were identified in the corridor study that have not yet been implemented. The locations of these improvements are shown in Figure 4.3. Additional information regarding these improvements follows Figure 4.3.

Table 4.6: Summary of U.S. 395 Safety Improvements Recommended as Near Term in the *U.S. 395 Southern Sierra Corridor Study (2007)*, not yet implemented

PROJECT	LIMITS AND ACTIONS	SCHEDULE	COST ESTIMATE*
Corridor Improvements			
1. Widen roadway markings	Entire corridor	6 months	\$ 36,000
Acceleration/Deceleration Lanes			
2. Jacks Valley Road	Extend three lanes southbound through intersection	18-36 months	\$480,000
3. Mica Drive	Add truck climbing lane to Sunridge Drive	18-36 months	\$720,000
4. South Sunridge Drive	Add northbound acceleration and deceleration lanes	18-36 months	\$480,000
5. Silver City RV Resort	Add northbound acceleration and deceleration lanes	18-36 months	\$570,000
6. Johnson Lane	Add northbound acceleration lane	18-36 months	\$780,000
Other Intersection Improvements			
7. Muller Lane	Install traffic signal	18-36 months	N/A
8. Ironwood Drive	Remove eastbound/westbound left-turns	18-36 months	N/A
Roundabouts			
9. Ironwood Drive	Construct roundabout	24-48 months	N/A
10. SR 88	Construct roundabout	24-48 months	N/A
Project Evaluations/Studies			
11. Roadway Access Management Study		6-18 months	\$ 20,000
12. Traffic Signal Installation and Coordination Study		18 months	\$420,000

* Cost estimate from 2007 *U.S. 395 Southern Sierra Corridor Study*, updated to 2016 dollars

2017 Douglas County Transportation Plan

Figure 4.3: Locations of U.S. 395 Safety Improvements Recommended as Near Term in the NDOT U.S. 395 Southern Sierra Corridor Study (2007) (Reference Table 4.6)

2017 Douglas County Transportation Plan

4.4.1 ACCELERATION/DECELERATION LANES

High-speed traffic makes entering and exiting U.S. 395 a difficult task. Adding or extending acceleration/deceleration lanes at intersections and driveways would improve this situation.

Jacks Valley Road

Currently, the right travel lane on southbound U.S. 395 becomes a right-turn only lane at the intersection of Jacks Valley Road. The 2007 Corridor Study recommends continuation of this lane through the intersection, ending south of the shopping center driveway south of Jacks Valley Road. It may be feasible to complete this project when future development occurs.

Mica Drive

Northbound trucks must come to a complete stop for the traffic signal at Mica Drive/Sunridge Drive, and their slow start-up speeds cause traffic to back up. It was recommended in the 2007 report that Douglas County pursue a project with NDOT to construct a truck climbing lane from Mica Drive to Sunridge Drive. The lane would allow for a right-turn lane to serve the residential area access from Sunridge Drive. Implementation would take between 18 and 36 months from the time of NDOT approval and funding.

South Sunridge Drive

New home construction in this area has increased the number of vehicles turning into and out of this street. Currently, vehicles must enter the outside travel lane to travel northbound. Northbound traffic must reduce its speed within the northbound outside travel lane to make a right-turn onto South Sunridge Drive. The 2007 Corridor Study recommends that Douglas County pursue a project with NDOT to add northbound acceleration and deceleration lanes to serve this traffic. The project would take between 18 and 36 months to complete from the time of NDOT approval and funding.

Silver City Recreational Vehicle Resort

Large recreational vehicles (RV) access a commercial site via a private driveway on U.S. 395 near South Sunridge Drive. Due to the size of the vehicles and the distance needed to decelerate for the approach or accelerate into traffic, longer deceleration and acceleration lanes are needed. Participants in the 2007 outreach effort recommended that Douglas County pursue a project with NDOT to lengthen the deceleration lane, add an acceleration lane, and lengthen the southbound left-turn lane into the RV park. The project would take between 18 and 36 months to complete from the time of NDOT approval and funding.

Johnson Lane

There is a need for an acceleration lane to facilitate traffic turning right from Johnson Lane onto U.S. 395. To widen U.S. 395 at this point, right-of-way is needed to relocate irrigation ditches and head gates. In addition, Johnson Lane should also be widened 14 feet to the north to allow for a right-turn lane. It was recommended in 2007 that Douglas County pursue a project with NDOT to make these changes. It would take an estimated 18 to 36 months to complete the project from the time of NDOT approval and funding, not including right-of-way acquisition.

2017 Douglas County Transportation Plan

4.4.2 ACCESS MANAGEMENT

It is necessary to manage the points where traffic enters and exits U.S. 395, which could be accomplished by eliminating or consolidating openings and moving traffic to grade-separated interchanges or newly constructed parallel routes. An Access Management Assessment was recommended in 2007. This detailed study would determine the number of approaches with median openings that should be combined, modified or removed. The study could be completed by NDOT staff at a cost of about \$20,000 in 6 to 18 months from the time of NDOT approval and funding.

4.4.3 ALTERNATE ROUTES

Suggestions for frontage roads and connections within existing county road systems were expressed during the 2007 traffic safety charrette process. Some people advocated for a new freeway alignment, while others envisioned new routes for local traffic that would preserve U.S. 395 for regional traffic. Realizing that these new roadways are expensive and require a long time to complete, these projects are listed in Section 4.5 Needs Assessment for Future Development along with other mid-term or long-term projects.

4.4.4 PAVEMENT MARKINGS

The 2007 Corridor Study recommended that NDOT replace faded markings with 8-inch-wide lines to improve visibility. The faded pavement markings have been replaced with standard width (6-inch) lines, not the wider 8-inch lines.

4.4.5 ROUNDABOUTS

Roundabouts are circular intersections with channelized approaches. In a roundabout, entering traffic yields to circulating traffic. Speeds are controlled by the design, and generally range from 15 to 27 mph. Roundabouts can be single or multiple lanes. The primary benefit of roundabouts is improved safety. Single and multiple lane roundabouts have fewer crashes with less severe injuries than signalized intersections and provide greater traffic capacity. Roundabouts are aesthetically pleasing and are sometimes used to create a gateway, or entrance, to communities.

Muller Lane

The characteristics of the U.S. 395 corridor become more suburban south of Muller Lane. During the public outreach for the 2007 update members of the public expressed the need for a gateway, or entrance, into the Minden area that would alert motorists of the need to slow down, using signs or a traffic signal. In 2007 the consultant team suggested consideration of a roundabout at this site. In 2016 the Town of Minden constructed gateway improvements (landscaping) at the U.S. 395/SR88 intersection.

2017 Douglas County Transportation Plan

Ironwood Drive

The 2007 Corridor Study recommended eliminating the left turn from the Ironwood Center onto U.S. 395 to reduce conflicts at this intersection. NDOT should partner with Douglas County to work with affected parties to ensure access needs are met.

4.4.6 TRAFFIC SIGNAL INSTALLATION AND COORDINATION

The 2007 Corridor Study recommended a Traffic Signal Installation and Corridor Study for the U.S. 395 corridor. Signal coordination is the process of timing traffic signals along a corridor to allow multiple signals to operate together as a group. It provides a means by which the sequence of green lights is established along a series of traffic signals to provide a consistent flow of traffic through a corridor.

Figure 4.4 shows the locations of existing signalized intersections in the U.S. 395 corridor through Minden and Gardnerville, as well as locations for potential future roundabouts or traffic signals. The estimated cost for completing the signal coordination project is \$420,000. The project could be completed within 18 months of initiation.

4.4.7 IMPLEMENTATION OF NEAR-TERM IMPROVEMENTS

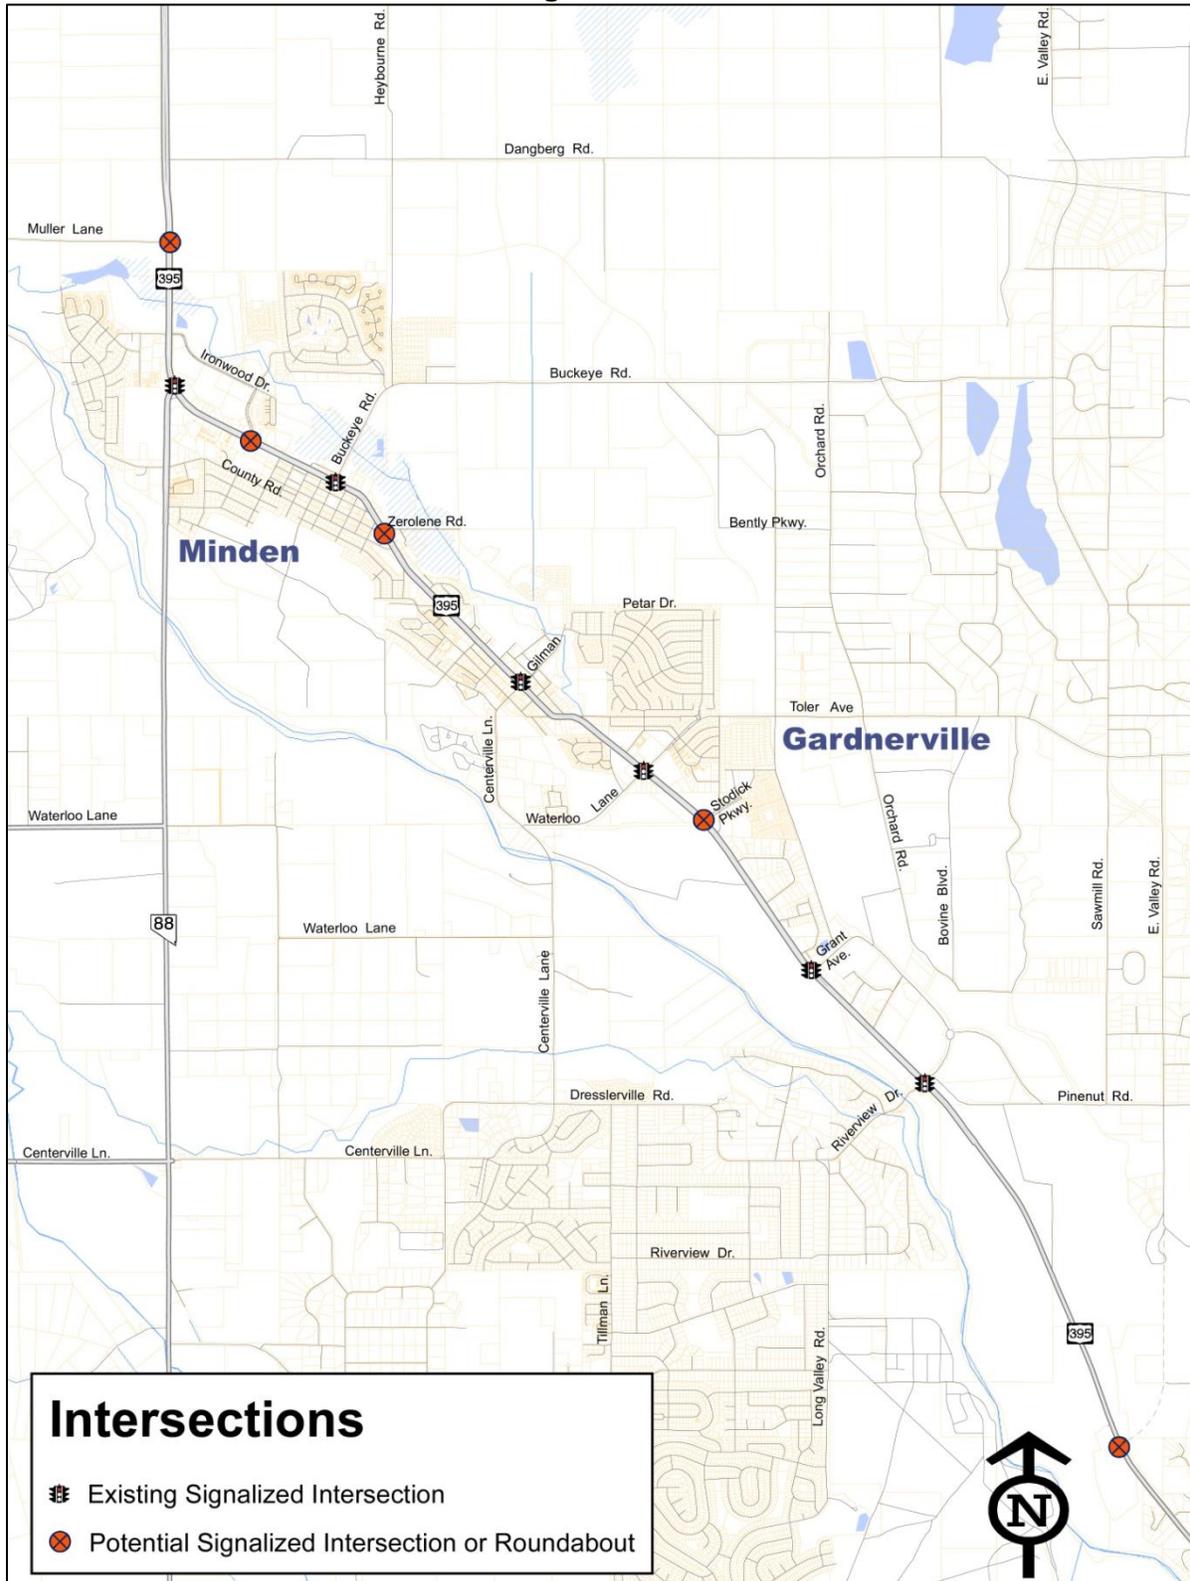

The 2007 Corridor Study public outreach effort resulted in numerous recommendations to improve safety on U.S. 395 between U.S. 50 and the Nevada/California state line over the next three to five years, most of which are located in Douglas County. Strategies for implementation are dependent on the type of process and available funding applicable to each recommendation.

According to NDOT procedures, Douglas County must submit an application for each individual project to NDOT. Once NDOT determines that the project application is complete, the project is ranked against other projects in the state. NDOT implements these projects as funding becomes available. Project steps include securing funding, working with Douglas County and property owners, and scheduling the work.

Some recommended improvements qualify for the NDOT Safety Improvement Program or as District II maintenance projects. Those include:

- Restripe shoulders and lanes with 8-inch wide markings
- Conduct access management assessment
- Eliminate left-turn lane at Ironwood Drive

Figure 4.4: Existing Traffic Signals and Potential Future Roundabouts or Traffic Signals in the U.S. 395 Corridor

2017 Douglas County Transportation Plan

The projects listed below must go through a project development process as required by the Nevada Legislature.

- Install acceleration/deceleration lanes
- Install truck climbing lane from Mica Drive to Sunridge Drive
- Extend third lane past Jacks Valley Road
- Lengthen right-turn pocket on Johnson Lane

The following short-term improvement projects are taken from the *2007 Douglas County Transportation Plan* and remain current in this updated Plan.

4.4.8 INTERSECTIONS ALONG U.S. 395 IN THE TOWN OF MINDEN

The 2007 Corridor Study noted that, as redevelopment occurs on parcels adjacent to the intersections of U.S. 395 with Esmeralda Avenue and Mono Avenue in Minden, there will be opportunities to acquire right-of-way to realign the intersections as perpendicular intersections. If right-of-way can be acquired, Douglas County can design and construct these improvements, similar to the realignment of County Road at U.S. 395.

4.4.9 U.S. 395 IN THE TOWNS OF MINDEN AND GARDNERVILLE

Goal 2 of the County's Valley Vision Plan (2013) reads "*Address noise, air quality, congestion, and traffic safety issues by diverting large truck traffic out of downtown areas.*" Additionally, both the Gardnerville Plan for Prosperity (2006) and the Minden Plan for Prosperity (2003) speak to the issue of traffic on U.S. 395 in the downtown area. Section One of the Gardnerville Plan states "*The increasing dependence on U.S. 395 to carry local and regional traffic has a negative impact on Minden's and Gardnerville's main street appeal*" while Section Two indicates that the public wants traffic calming and improved pedestrian access along the highway through Town. Section Two of the Minden Plan indicates that access to downtown, by cars and pedestrians, is enhanced by providing parking and pedestrian improvements, and Section Three includes an action item for downtown streetscaping.

Recent (2015) counts provided by the Nevada Department of Transportation show an average of 669 heavy (semi and multiple trailer) trucks per day travelling through the downtown area. This is approximately three percent of the total traffic volume.

Diverting trucks from downtown requires the establishment of a route around the downtown area that is available to trucks and convenient for their use. One such route could be Waterloo Lane Extension from U.S. 395/Stodick Parkway due west to SR 88, with designation as an "express route" for trucks and cars. This improvement would also provide a much-needed east/west route for trucking of construction materials. Although it would reduce overall downtown traffic somewhat, it would not eliminate the need for Muller Parkway to reduce congestion on U.S. 395 through Minden and Gardnerville.

2017 Douglas County Transportation Plan

The Town of Gardnerville supports the construction of Muller Parkway as a means of removing trucks from downtown. In fact, the Town’s Strategic Plan contains the action item “*Work with other agencies to make Muller Parkway a truck bypass. After bypass is complete work to create a center median on Main Street to beautify the downtown.*” However, this is in direct opposition to action previously taken by the Board of Commissioners. On January 6, 2005 the Board approved the current Muller Parkway alignment with the understanding that heavy trucks would be prohibited from the roadway except for local deliveries. The action taken by the Board is recorded in the minutes of the meeting as, “MOTION by Kite/Smith to approve the report as it was sent to the Planning Commission and to confirm the previous adoption of the resolution with the addition of language it is not to be a truck route and with the understanding that local deliveries would be acceptable; carried with Commissioner Johnson voting Nay and Commissioner Etchegoyhen abstaining.”

When evaluating these two potential options for removal of trucks from the downtown area, the pros and cons of each project should be considered. The Waterloo Extension from SR 756 (Centerville Road) to SR 88 would provide a truck route around the downtown area, but this project would have no appreciable impact on LOS on U.S. 395 through the towns, or elsewhere. It would serve only this one purpose. Muller Parkway, on the other hand, is needed regardless of whether or not Waterloo Lane Extension is constructed. It is needed to address future LOS deficiencies at a number of locations, including U.S. 395 through town, U.S. 395 north of the SR 88 intersection, and on Buckeye Road. Should the Board desire to reverse its 2005 action designating Muller Parkway as “not a truck route” (local deliveries allowed), Parsons recommends that the County solicit input from the public on this issue prior to making its decision.

Traffic congestion in the downtown area could also be improved by providing alternative modes of transportation, and by enhancing existing services. DART, BlueGo and the Carson Valley Airporter currently operate in the downtown area and beyond. The County could consider expanding the DART service to provide reduced headways (i.e., more frequent pickup and drop-off times.) Trolleys, either on-street with rubber tires or operating on fixed rails, could provide alternatives to travel by automobile while enhancing the experience of visitors and residents alike. (Detailed maps showing potential future alignments for the V&T Railroad in the downtown area are included in Appendix B.) Landscape, sidewalk and lighting improvements would improve walkability and encourage more pedestrian activity downtown. Finally, a traffic signal study that evaluates signal timing and the potential for traffic signal coordination should be considered for U.S. 395 corridor from Riverview Drive to SR 88.

As redevelopment occurs on parcels adjacent to U.S. 395 in Minden and in Gardnerville, site plans should be reviewed to identify opportunities to consolidate and organize driveway access locations. Implementation of these driveway modifications will improve safety and traffic flow within the corridor.

2017 Douglas County Transportation Plan

4.4.10 STATE ROUTE 88 INTERSECTIONS

Douglas County will continue to coordinate with NDOT to monitor traffic volumes and intersection delays at critical locations (County Road, Waterloo Lane, Centerville Road, Kimmerling Road). If localized intersection improvements are warranted, Douglas County will coordinate with NDOT to implement intersection improvements.

4.5 Needs Assessment for Future Development

Recent development approvals indicate the potential for substantial new residential development in the next 10 to 15 years. (Refer to Table 2.5, Tentatively Approved Residential Subdivisions, and Table 2.6, Approved Specific Plans.) The additional trips created by new development in both Douglas County and Carson City will add to existing traffic volumes, causing some County roadway segments to fall below LOS C, and some additional NDOT segments to fall below LOS D unless new transportation projects are constructed.

While land developers construct local transportation improvements in the vicinity of their projects, local growth has a regional impact on the transportation network. These regional impacts will not be mitigated by the current inventory of local roadway improvements. Therefore, a primary objective of the *2017 Douglas County Transportation Plan* is to identify regional infrastructure improvements that will preserve a high quality-of-life for Douglas County’s current and future generations of residents as development continues.

If residential and commercial development continues at the Historic Growth Rate of 1.39 percent through 2025 and no capacity increasing projects are implemented, the traffic level of service on roadway segments in Douglas County will fall below acceptable LOS standards as shown below. Projects are listed in decreasing order of LOS failure, worst first.

Table 4.7 2025 LOS Deficiencies with Existing Road Network (no projects)

ROAD SEGMENT	ALLOWABLE LOS	ANTICIPATED LOS
U.S. 395 from U.S. 50 to Mica Drive	D	F
U.S. 395 from Muller Lane to Ironwood Drive	D	F
U.S. 395 from Mica Drive to Stephanie Way	D	E
U.S. 395 from Ironwood Drive to SR 88	D	E
U.S. 395 from Cemetery Lane to Gilman Road	D	D/E
Stephanie Way from U.S. 395 to Heybourne Road	C	D
Riverview Drive from Dresslerville Road to U.S. 395	C	C/D

As the current population of Douglas County grows to the projected population of 70,400 in 2040, and if no capacity increasing projects during that time, the number and magnitude of the deficiencies will continue to grow. The following table shows the anticipated deficiencies in 2040 with the existing road network plus completion of Heybourne Road from Buckeye Road to Meridian Boulevard.

2017 Douglas County Transportation Plan

Table 4.8 2040 LOS Deficiencies with Existing Roadway Network plus Mid-term Project #5 Heybourne Road

ROAD SEGMENT	ALLOWABLE LOS	ANTICIPATED LOS
U.S. 395 from U.S. 50 to Stephanie Way	D	F
U.S. 395 from Muller Lane to Ironwood Drive	D	F
Riverview Drive from Dresslerville Road to U.S. 395	C	E/F
U.S. 395 from Ironwood Drive to SR 88	D	E
Buckeye Road from U.S. 395 to Heybourne Road	C	E
SR 756 (Centerville Lane) from S. Waterloo Lane to N. Waterloo Lane	D	E
U.S. 395 from Cemetery Lane to Toler Lane	D	D/E
Stephanie Way from U.S. 395 to Heybourne Road	C	D
Buckeye Road from Heybourne Road to Sanford Street	C	D
Heybourne Road from Buckeye Road to Stockyard Road	C	D
Dresslerville Road from Riverview Drive to Long Valley Road	C	C/D

Table 4.9 lists the mid-term, Phase 1 projects needed to maintain LOS C on roads maintained by Douglas County and LOS D on roads maintained by the Nevada Department of Transportation through 2025. The projects are listed in order of importance, most important first, as determined by the severity of the LOS deficiency that each project addresses. For example, the first four projects in table 4.9 are needed to address the worst anticipated 2025 deficiencies (LOS F) in table 4.7. The last project in table 4.9 addresses the least (and last) of the deficiencies identified in table 4.7.

Table 4.10 lists the Long-term, Phase 2 projects planned for Douglas County by 2040, needed to maintain LOS C on roads maintained by Douglas County and LOS D on roads maintained by the Nevada Department of Transportation through 2040.

Table 4.11 lists projects identified to provide alternate local and regional access that are not needed to maintain LOS standards within the 2040 planning horizon. Many of these projects were identified in the 2007 Plan as being needed to maintain LOS standards. However, the updated growth rate of 1.39 percent generates lower populations and lower traffic volumes compared to the 2.0 percent growth rate utilized in the 2007 Transportation Plan. As a result, many of the projects that were identified in the 2007 Transportation Plan are not needed to maintain LOS standards in this updated plan within the 2040 planning horizon.

Three of the projects in Table 4.11 were identified in the public input process for the 2007 Plan and were not deemed necessary to maintain LOS standards. Those are the Vicky Lane Extension to the Carson Freeway, the Heybourne Road Extension to the Carson Freeway, and the Carson Valley Eastside Bypass to the Carson Freeway. Figure 4.5 maps the locations of all of the projects listed in tables 4.9, 4.10 and 4.11.

2017 Douglas County Transportation Plan

The 2017 Douglas County Transportation Plan uses 2040 as the horizon year for planning purposes. As Douglas County continues to grow beyond that date, new transportation facilities will need to be planned and developed to accommodate future growth.

Many of the transportation projects identified on Figure 4.5 involve establishment of alignments for new roads. The alignments shown for these projects are conceptual. floodplains, steep topography, land ownership and restrictions on land use can impact projects costs, and all of these should be considered when establishing final alignments associated with new road construction. Current FEMA floodplain information can be found on the FEMA website at <https://msc.fema.gov/portal/search>. Figure 4.6 shows the topography of the Carson Valley. Figure 4.7 shows land ownership by State and Federal agencies, as well as Native American owned lands and land that is subject to conservation restrictions.

Table 4.9: Proposed Transportation Projects—2017 to 2025 (Mid-term) Needed to Maintain LOS C on Douglas County Roadways and LOS D on NDOT Roadways

ID #	ROAD	SEGMENT	IMPROVEMENTS	ESTIMATED COST**
1	U.S. 395	I-580/US50 to Jacks Valley Road	Segment 1 freeway improvements identified in the U.S. 395 Southern Sierra Corridor Study (U.S. 395 SSCS)*; overpasses at Old Clear Creek Road and Topsy Lane; interchange at Jacks Valley Road; frontage roads on both sides of freeway	\$256,600,000
2	U.S. 395	Jacks Valley Road to South Sunridge/Plymouth Drive	Segment 2 freeway improvements identified in the U.S. 395 SSCS*; overpass at Mica Drive; interchange at South Sunridge/Plymouth Drive; frontage roads on both sides of freeway	\$ 73,900,000
3	Muller Parkway	Monte Vista Avenue to Pinenut Road	Construct new 4-lane arterial	\$ 39,400,000
4	Heybourne Road	Monterra Drive to Meridian Boulevard	Construct new 2-lane collector	\$ 25,400,000
5	U.S. 395	South Sunridge/Plymouth Drive to Johnson Lane	Segment 3 freeway improvements identified in the U.S. 395 SSCS*; overpass at Stephanie Way; interchange at Johnson Lane; frontage roads on both sides	\$ 87,400,000
6	Stephanie Way	U.S. 395 to S. Santa Barbara Drive	Widen existing road from 2 lanes to 4 lanes	\$ 11,200,000
7	Riverview Drive	Dresslerville Road to U.S. 395	Widen existing road from 2 lanes to 4 lanes	\$ 10,000,000
Total				\$503,800,000

* U.S. 395 Southern Sierra Corridor Study, 2007 (NDOT)

** Estimated costs are based on the U.S. 395 SSCS (2007) costs, adjusted for inflation to 2016 using CPI data (average 2%/year)

2017 Douglas County Transportation Plan

Table 4.10: Proposed Transportation Projects—2026 to 2040 (Long-term) Needed to Maintain LOS C on Douglas County Roadways and LOS D on NDOT Roadways

ID #	ROAD	SEGMENT	IMPROVEMENTS	ESTIMATED COST**
8	U.S. 395	Jacks Valley Road to Mica Drive	Widen freeway to 6 lanes to match the 6 lanes north of Jacks Valley Road	\$ 6,000,000
9	U.S. 395	Johnson Lane to Muller Parkway	Segment 4 freeway improvements identified in the U.S. 395 SSCS*; interchanges at Airport Road/Genoa Lane; interchange or roundabout at Muller Parkway	\$147,300,000
10	Genoa Lane	West of U.S. 395	Realign Genoa Lane to meet Airport Road to facilitate a single interchange for both roads	\$ 4,000,000
11	U.S. 395	Muller Parkway to SR 88	Segment 5 improvements identified in the U.S. 395 SSCS*; widen U.S. 395 from 4 lanes to 6 lanes	\$ 12,400,000
12	U.S. 395	Riverview Drive/Muller Parkway to Rockbottom Road	Segment 7 improvements identified in the U.S. 395 SSCS*; widen from 2 lanes to 4 lanes with a continuous center left turn lane	\$ 34,800,000
13	Heybourne Road	Buckeye Road south to Gilman Avenue	Construct new 2-lane collector	\$ 14,500,000
14	Heybourne Road	Gilman Avenue east to Muller Parkway	Construct new 2-lane collector	\$ 11,500,000
15	Dresslerville Road	Riverview Drive to Long Valley Road	Widen from 2 lanes to 4 lanes	\$ 7,400,000
Total Project Cost				\$238,000,000

* U.S. 395 Southern Sierra Corridor Study, 2007 (NDOT)

** Estimated costs are based on the U.S. 395 SSCS (2007) costs, adjusted for inflation to 2016 using CPI data (average 2%/year)

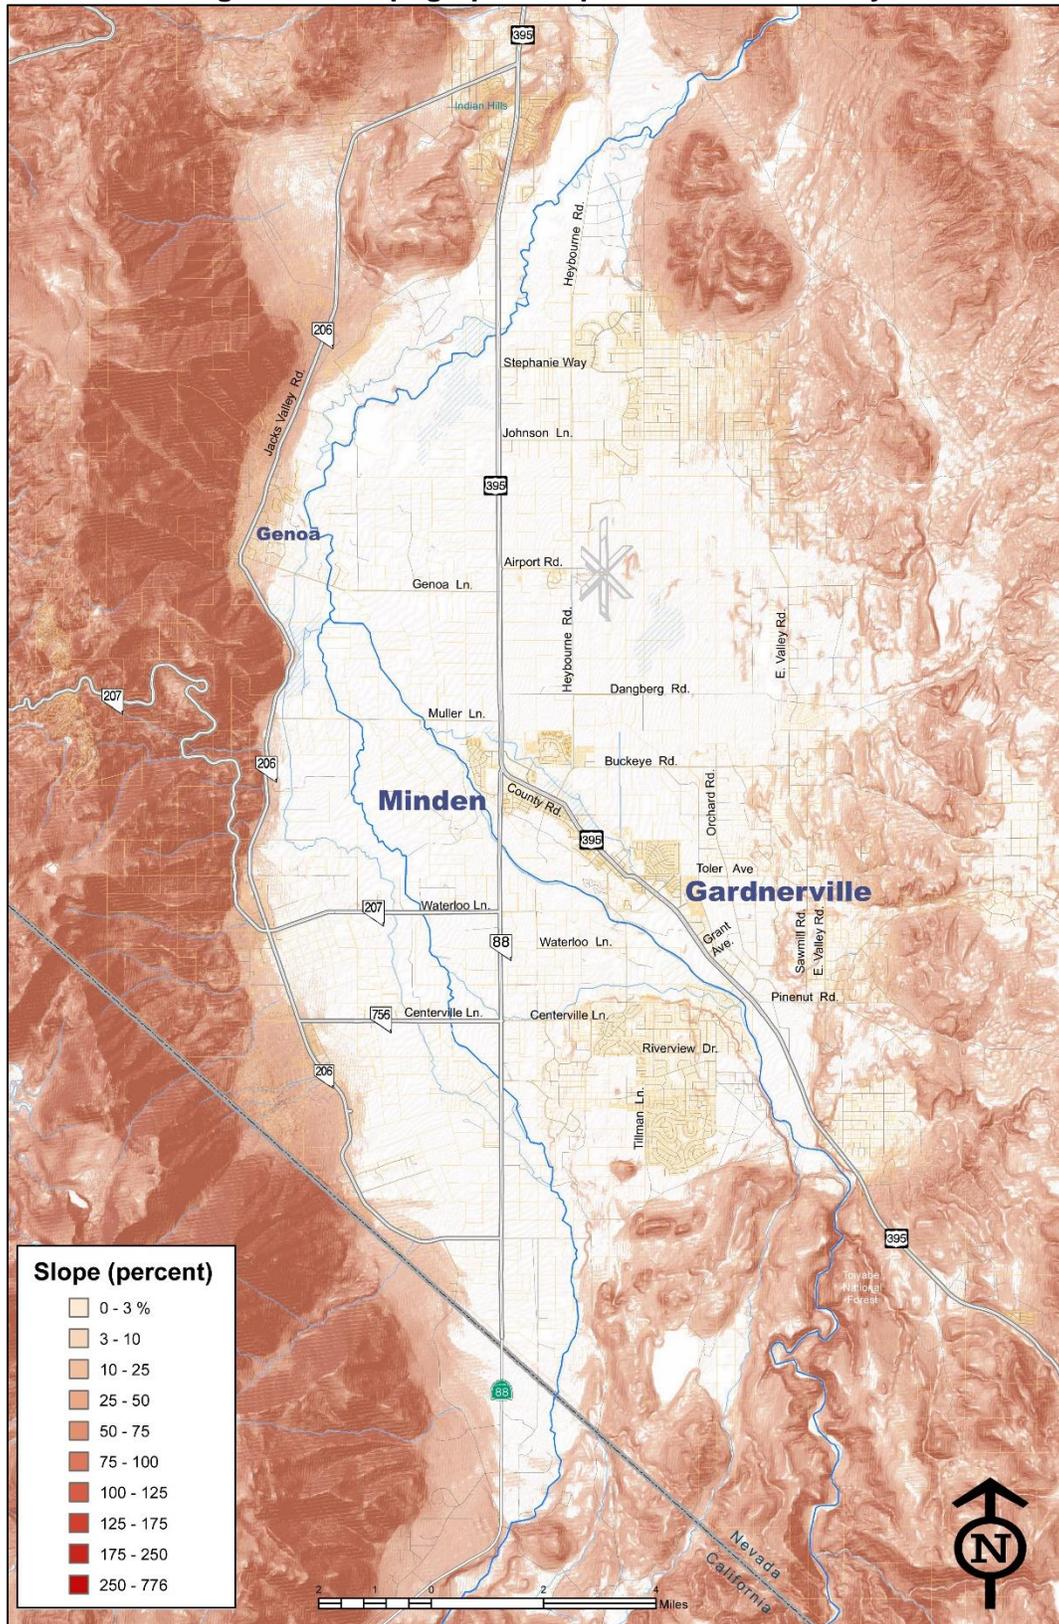

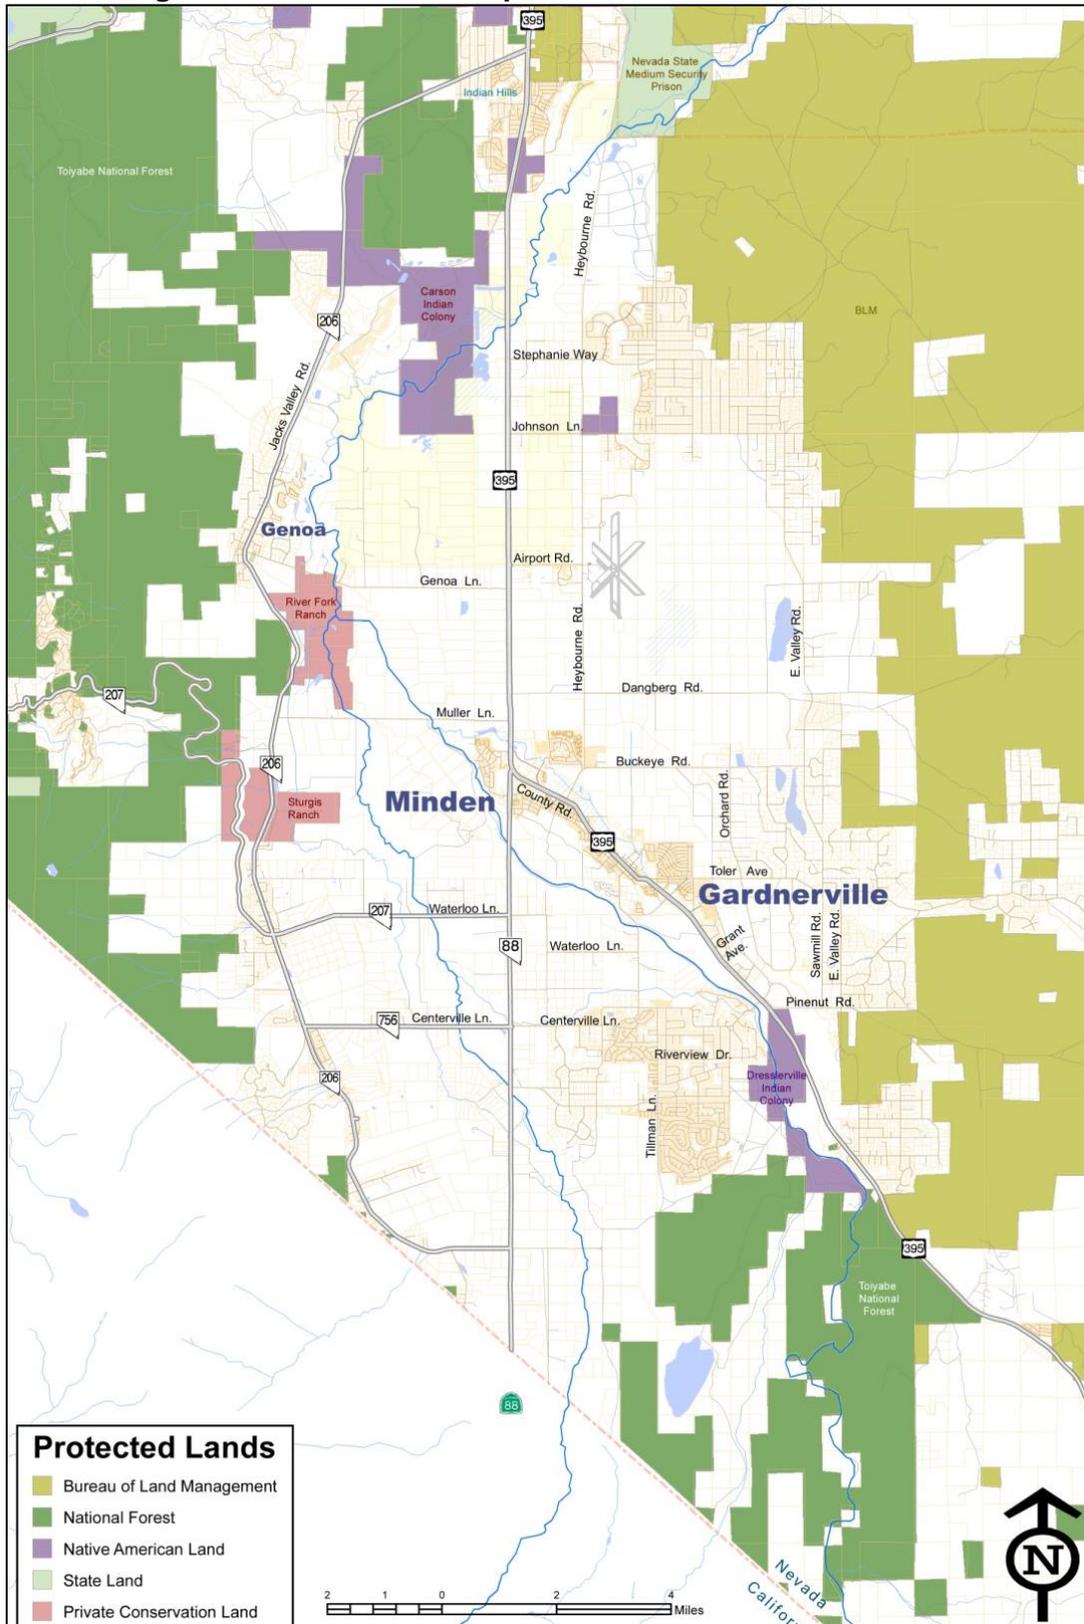

Figure 4.7: Land Ownership and Private Conservation Areas

4.6 Douglas County Street and Highway Design Standards

Each of the roadway functional classifications has different characteristics. Design standards vary with each functional classification relative to the character of the service that they provide. Roadways should be designed in accordance with the following referenced guidelines.

Nevada Department of Transportation Jurisdictional Roadways

Road Division Design, Design Manual, Parts 1 and 2, latest edition, Nevada Department of Transportation.

Douglas County Jurisdictional Roadways

Please refer to the *Douglas County Design Criteria and Improvement Standards Manual* for project standards.

Typical roadway sections and associated rights-of-way are contained in the current version of the *Douglas County Design Criteria and Improvement Standards Manual*. The right-of-way requirements were established to accommodate the roadway and local street drainage only. Additional right-of-way to accommodate drainage facilities for other than local street drainage (off-site) may be required. Additional easements/right-of-way may be required for slopes and construction.

4.7 Emergency Access Routes and Flooding

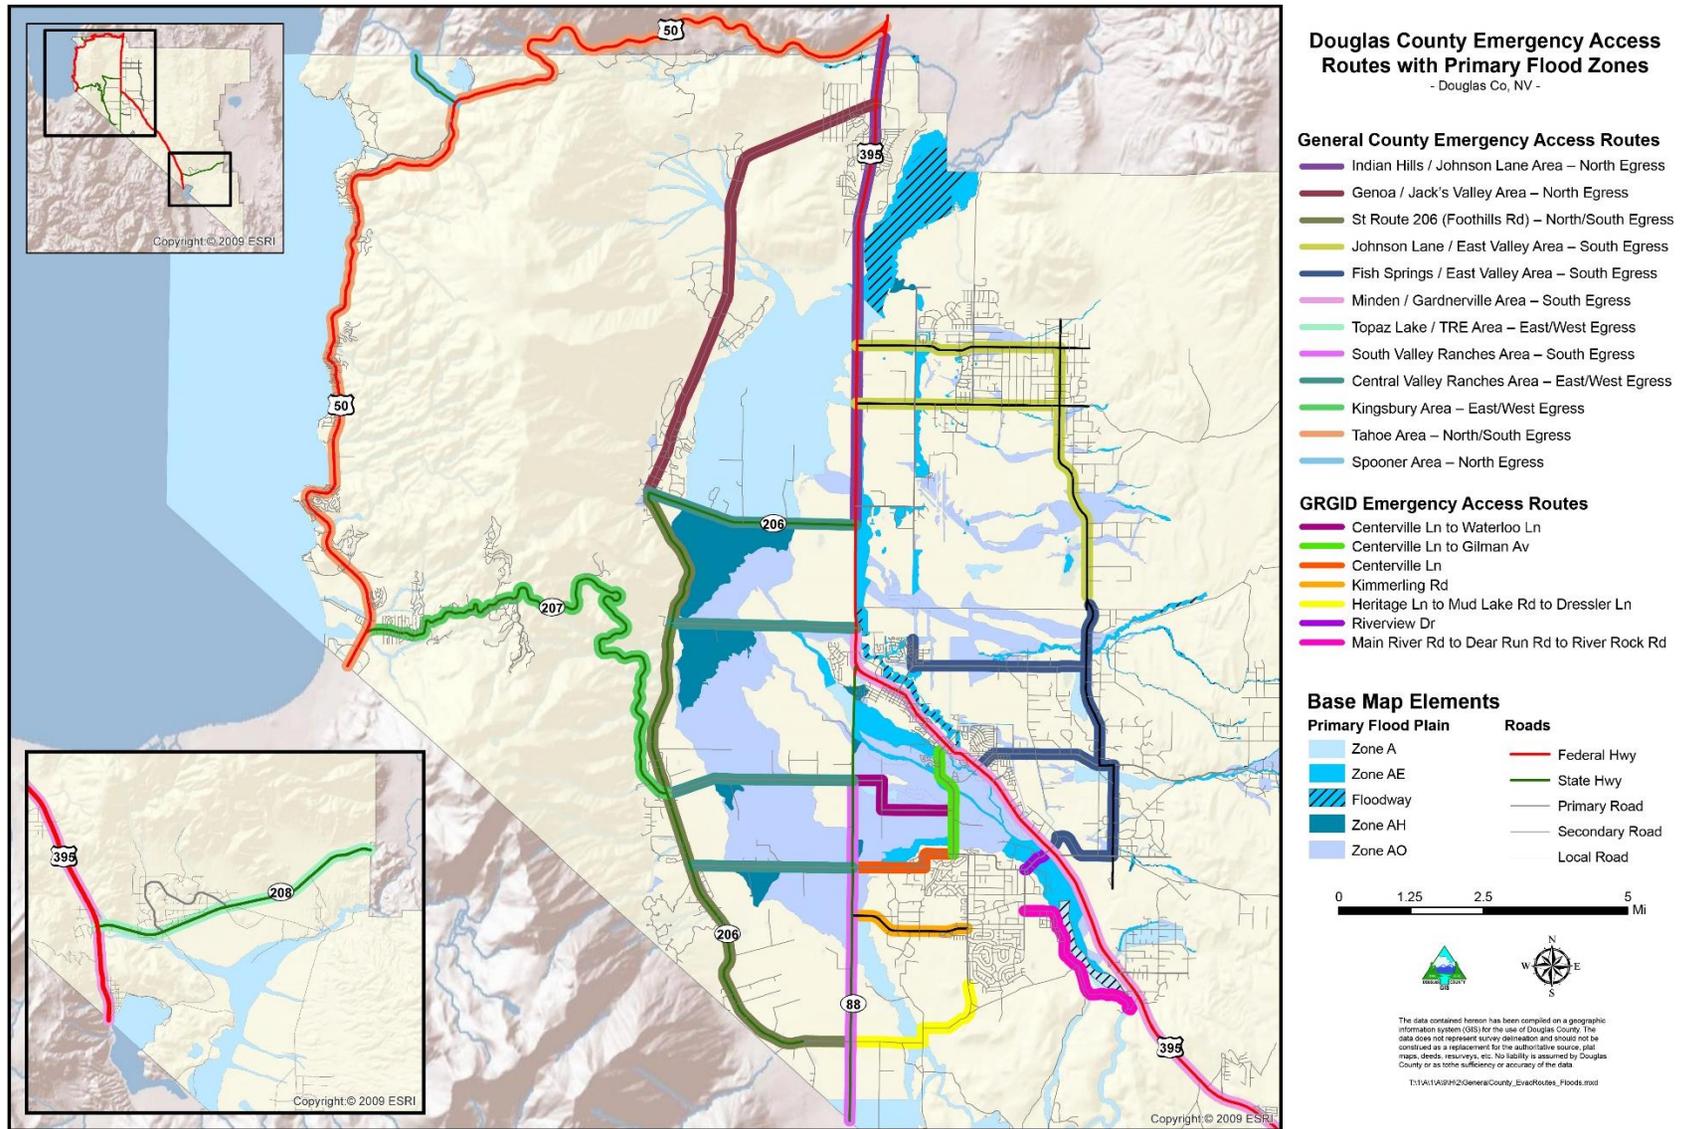

Although much of Douglas County is a high desert, flood events are not uncommon. Summer thunderstorms frequently generate localized flood events, and winter rains on snowpack can generate regional flooding. Figure 4.8, Douglas County Emergency Access Routes with Primary Flood Zones, is based on the Evacuation Routes map prepared by East Fork Fire and Paramedic Districts and Douglas County Geographic Information Systems (GIS). Ironwood Drive Extension is specifically designated as *not* an emergency access route.

4.8 Complete Streets

Complete streets refers to retrofitting roads that are under the jurisdiction of a County Commission or Regional Transportation Commission to add or repair facilities that provide safe access for all users including pedestrians, bicyclists, persons with a disability, persons who use public transportation and motorists. The term includes the operation of a public transit system but does not include the purchase of vehicles or other hardware for operation of a public transit system.

Designing complete streets can increase the overall capacity of the transportation network by encouraging more transportation modes than just private automobiles. They also encourage exercise in the forms of walking and cycling, and can reduce vehicle emissions, improve safety and promote economic development. Adopting a Complete Streets Policy means routinely designing to provide safe access for all users of all ages and abilities, regardless of mode of travel.

Figure 4.8 Map of Douglas County Emergency Access Routes with Primary Flood Zones

2017 Douglas County Transportation Plan

In 2013 the Nevada State Legislature approved legislation that provides funding for Complete Streets programs through the Nevada Department of Motor Vehicles. During the vehicle registration process, citizens have the option to make a voluntary donation to the Complete Streets Program. These funds are then set aside for use in the county in which they were collected. Under the legislation, a county may adopt a policy for a “Complete Streets Program” and may plan and carry out projects related to the program.

The Douglas County Regional Transportation Commission approved a Complete Streets Policy Statement on January 19, 2016 and is currently collecting funds from the program.

Chapter 5 PUBLIC TRANSPORTATION ELEMENT

Public transportation is an important part of the overall transportation system, providing mobility to residents who do not have access to private vehicle usage, such as people with low incomes, the elderly and persons with disabilities. Public transportation also has the potential to reduce traffic congestion and vehicle emissions, depending on the number of people using the system. In addition to providing mobility within Douglas County, public transit allows residents to access regional employment, education and health care services located in the Carson City and Reno/Sparks area.

Douglas County is primarily a rural county, with a small, urbanized area surrounding Minden and Gardnerville. Because of Douglas County’s dispersed pattern of development, transit must be carefully designed to serve the county’s population at a reasonable cost. Lifeline transit services, such as the ones connecting Topaz Lake with north Douglas County and Kingsbury Grade to Lake Tahoe, allow Douglas County residents and visitors to reach essential services and activities with reasonable frequency.

5.1 Existing Public Transportation Services

It must be noted that transit service operations change frequently in response to market conditions. Accordingly, the schedules contained herein may or may not be current.

5.1.1 DOUGLAS AREA RURAL TRANSIT (DART) DIAL-A-RIDE

Douglas County operates the Douglas Area Rural Transit (DART) Dial-A-Ride service, which carries passengers between the southern-most and northern-most points of the county along the U.S. 395 corridor. Most of this service occurs in the rural portions of Douglas County, allowing for use of funding from the Federal Transit Administration’s Rural Transit Assistance Program.

The Dial-A-Ride service extends from the Topaz Ranch Estates Community Center (near Topaz Lake) in the south to the Indian Hills community in the north. The Dial-A-Ride provides door-to-door service to seniors age 60 and over and disabled persons for shopping, medical appointments, recreation, Senior Center visitation and more. Rides must be scheduled in advance.

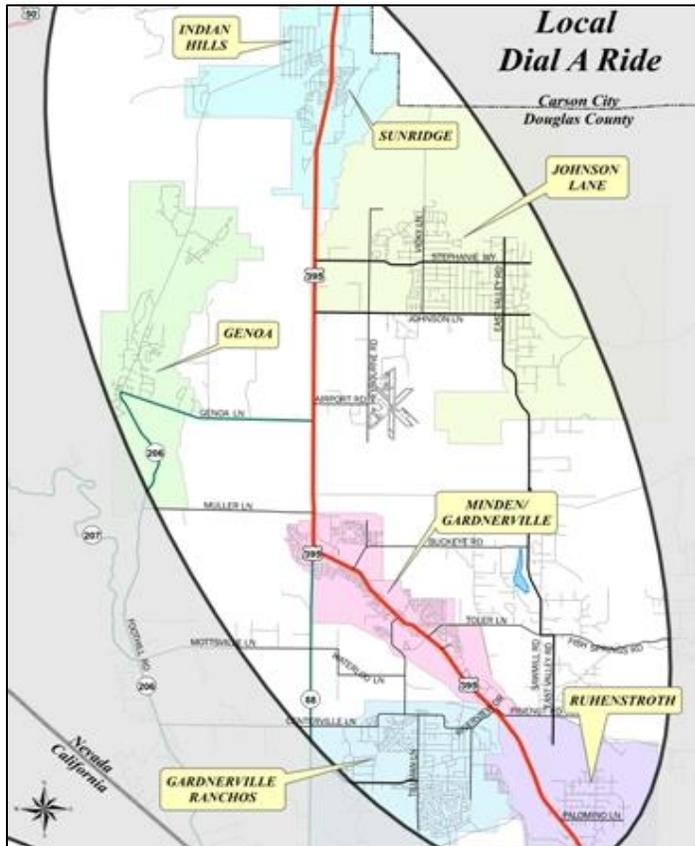

DART is funded with a one percent room tax on transient occupancy, Federal Transit

DART driver Renée D’Accardo proudly displays her vehicle

2017 Douglas County Transportation Plan

Figure 5.1: DART Service in Effect as of April 2016

 Note: Best quality map available at the time of publication.

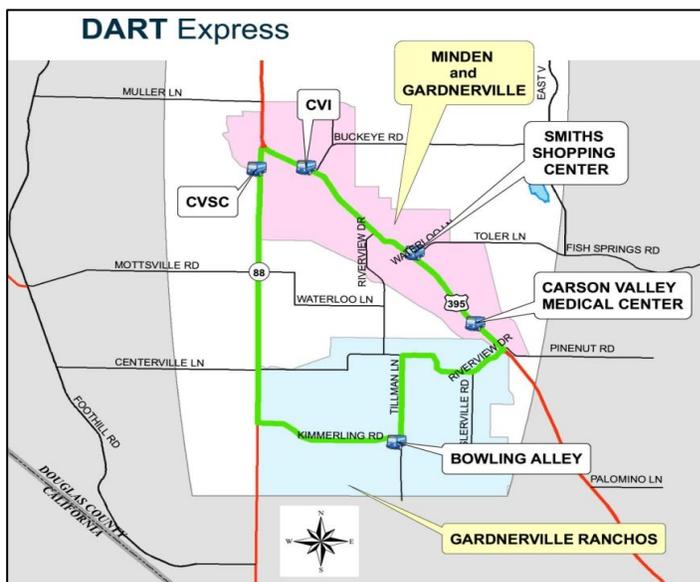

Administration funds and the Douglas County General Fund. The cost for fiscal year 2014–2015 is \$493,378.

For the period from July 2014 through June 2015, DART public transportation provided 33,755 passenger trips (an average of 2,813 trips per month). Vehicle revenue miles totaled 169,381. Vehicle revenue hours totaled 13,800, operating 13 hours per day for the entire year. Douglas County collected \$11,500 in passenger fares during this time period.

5.1.2 DART EXPRESS

DART Express is a public fixed route that transports passengers to Minden, Gardnerville and the Gardnerville Ranchos. Specific transfer points are built into the route, to be shared with the Tahoe Transportation District for passengers seeking to ride north to Carson City (19X Express Route) or to South Lake Tahoe and Stateline ski areas (20X Lake Express Route). Once in Carson City, passengers can take Washoe RTC intercity regional transit service to Reno and Sparks.

Figure 5.2: DART Express Route Map

Source: Douglas County, Nevada, www.douglascountynv.gov/

For visitors and residents of Douglas County, the DART Express offers transportation to points of interest such as Tillman Center, the Carson Valley Medical Center, shopping centers located in Gardnerville (Smith’s, Raley’s, and Grocery Outlet), Herbig Park, Lampe Park, the senior center, the Carson Valley Inn, the library and Carson Valley Swim Center.

5.1.3 BlueGo TRANSIT SERVICE

Transit service in Douglas County is connected to the Lake Tahoe area through the Tahoe Transportation District (<http://www.tahoetransportation.org/>). A new, expanded BlueGo (<http://www.BlueGo.org>) bus service that connects South Shore to Carson Valley goes on to Carson City.

Fares are \$4.00 for intercity trips and \$2.00 within local areas with half-price fares offered to youth, seniors and those with disabilities. Transfer stations are located at Tillman and Kimmerling in Gardnerville, and in Carson City at Washington and Plaza Streets.

To meet growing public demand for public transit, the agencies have simplified the fare structure, allowing transportation managers to hold the line on bus fares without major price increases. In the current fare structure, BlueGo will continue its \$3.00 on-call plan for seniors and the disabled. This on-call fare is available to persons aged 60 or older, Medicare or Medicaid card-holders, or those with a valid special needs or ADA credential. For all others, the cost for on-call service is \$10.00.

See Figure 5.3 for a map of the Valley and Lake Express routes, and Table 5.2 for the fixed-route schedule for the Nevada Route.

5.1.5 EASTERN SIERRA TRANSIT

Eastern Sierra Transit provides round trip transit along U.S. Highway 395 between Lone Pine and Reno on Mondays, Tuesdays, Thursdays and Saturdays. The service makes one round trip daily from Lone Pine, stopping at (among other locations) Smith’s in Gardnerville (currently 10:45 a.m. northbound, 24-hour advance reservation required) and at the Carson Nugget in Carson City. On the southbound trip it stops at the AM/PM mini-market, 1338 U.S. Highway 395 on the corner of Waterloo Lane (2:30 p.m., 24-hour advance reservation required).

2017 Douglas County Transportation Plan

5.2 Evaluating Douglas County Transit Services

Public transit services should be evaluated regularly to determine if they are meeting locally established transportation objectives. One method for analyzing transit operations is to review certain quantifiable data, such as operating costs, passenger trips, fare revenue, vehicle revenue hours and miles traveled. Table 5.4 provides DART performance measures and performance indicators data for fiscal year 2014–2015.

DART is a popular and efficient service, providing 33,755 passenger trips during fiscal year 2014–2015. These trips provided transportation to the elderly and persons with disabilities, as well as regular and deviated fixed route service. The low fare recovery ratio (2.3 percent) reflects the very low fare per passenger, which is related to the social service nature of the program.

**Table 5.4: DART Measures of Effectiveness—
FY 2014 to FY 2015**

DOUGLAS AREA RURAL TRANSIT	
Performance Measures	
Operating cost	\$493,378
Fare revenue	\$11,500
Vehicle revenue hours	13,800
Vehicle revenue miles	169,381
Total passenger trips	33,755
Performance Indicators	
Operating cost/hour	\$35.75
Operating cost per passenger trip	\$14.62
Passenger trips/hour	2.45
Passengers trips/mile	0.2
Fare recovery ratio	2.33%

Source: Douglas County Community Services Division

5.2.1 PERFORMANCE MEASURES

The following definitions of performance measures and performance indicators are consistent with the definitions provided in the Federal Transit Administration National Transit Database. See Table 5.4 for DART performance measures.

Operating Cost

The full cost of operating the transit system, excluding the following items: (a) costs of depreciation and amortization, (b) direct costs of providing charter service, (c) vehicle lease costs, and (d) premiums for liability and casualty insurance and payments of liability claims.

Fare Revenue

Revenue collected from fares plus ticket/pass sales.

Vehicle Revenue Hour

The time during which a revenue vehicle is available to carry fare paying passengers, and which includes only those times between the time or scheduled time of the first passenger pickup and the time or scheduled time of the last passenger drop-off during a period of the vehicle's continuous availability.

Vehicle Revenue Mile

Those miles traveled by revenue vehicles during their vehicle revenue hours.

Total Passenger Trips

Total number of unlinked trips; all boardings, whether revenue producing or not.

5.2.2 PERFORMANCE INDICATORS

Each of these performance indicators is obtained by using simple computation of the performance measures above. See Table 5.4 for DART indicators of service effectiveness.

Operating Cost per Hour

Total operating costs for transit service divided by total hours of service provided.

Operating Cost per Passenger Trip

Total operating costs for transit service divided by total number of passenger trips provided.

Passenger Trips per Hour

Total number of passenger trips divided by total hours of vehicle revenue service provided.

Passenger Trips per Mile

Total number of passenger trips divided by total number of vehicle revenue miles.

Fare Recovery Ratio

Total fare revenues divided by total operating costs for transit service, expressed as a percentage.

5.3 Public Transportation Needs Assessment and Issues

Transit service routes are designed to connect riders with their points of origin and destination. As such, a number of key attractors should be considered when establishing transit routes. These include population centers, shopping centers, employment centers, travel hubs, education and recreation facilities.

As indicated earlier in this chapter, several entities currently provide transit services within and through Douglas County. These include DART, BlueGo, the Carson Valley Airporter and Eastern Sierra Transit. In aggregate these operations serve most of the key attractors within the Carson Valley, including the Tillman Center, Douglas County Senior Center, Herbig Park, Carson Valley Medical Center, Carson Valley Inn, Smith's shopping center, Carson Valley Swim Center and Douglas County Library. They also serve the population centers of the Gardnerville Ranchos and the downtown Minden Gardnerville area, as well as the employment areas clustered along U.S. 395 through downtown, and the Stateline casino area. Furthermore, these services connect to Washoe RTC transit providing Douglas County residents with transportation to Reno and the Reno-Tahoe International Airport.

There are a few existing attractors in Douglas County where public transit service is lacking. These include Western Nevada College, the Minden/Tahoe Airport, the Johnson Lane area, the Target shopping center, and the Carson Valley Plaza (north Walmart shopping center). The transit providers should evaluate the potential ridership associated with these attractors and consider modifying their existing routes to serve these locations.

As Douglas County continues to focus growth in the Minden–Gardnerville area and along U.S. 395, residents expect and need a more active transit service in this corridor. The estimated increase in population to 70,400 by 2040 will likely require the development of more frequent fixed route and demand responsive service covering a wider geographical area. This expanded service will become especially important as Douglas County attracts a larger population of retired residents who require more public transportation services. Increased regular transit service will require expanded DART service to transport disabled and elderly riders to health care, personal business, and shopping trips. DART currently meets all the requirements of the Americans with Disabilities Act (ADA), by providing equal access to the Douglas County transit service for disabled riders.

Increased tourist and employment activity in the Lake Tahoe area will also require an increased role for public transportation in this region. More people will visit Douglas County looking for alternatives to driving alone in single-occupant vehicles. Expanded transit service will add to the attractiveness of this already popular tourist area, by making travel convenient and accessible.

2017 Douglas County Transportation Plan

Employment growth also signals the need for expanded public transit services. With new employment facilities concentrated around the Minden–Tahoe Airport, North County and downtown Gardnerville and Minden, there will be increased demand for services in these areas. Flexible fixed route, demand-responsive and vanpool services should be considered for these employment centers.

Transit service costs will continue to rise due to increased costs for fuel, liability insurance, maintenance and labor. Douglas County will need to carefully evaluate additional transit programs to determine which services are most cost-effective. By reviewing the performance measures and the performance indicators each year, local policy makers will have the information to make effective decisions about transit service levels.

It would be appropriate for Douglas County to prepare a short range transit plan within the next three years to determine the logistics of implementing improved local transit services, including the following issues:

- Expand transit service hours, especially evenings and weekends.
- Expand transit service areas and routes to serve the key attractors where service is currently lacking.
- Connect rural communities in northern Nevada.
- Increase frequency for demand-responsive service in compliance with the Americans with Disabilities Act.
- Develop transit system goals and objectives.
- Develop a comprehensive transit financial plan.
- Preserve a transit corridor along the former Virginia & Truckee Railroad right-of-way.

2017 Douglas County Transportation Plan

5.4 Future Transportation Options

5.4.1 CARSON VALLEY/LAKE TAHOE GONDOLA

In considering potential future transportation options, Douglas County staff requested a brief analysis of a potential future gondola connection between the Carson Valley and the Lake Tahoe area. Representatives of the Heavenly Mountain Ski Resort, the Tahoe Regional Planning Agency (TRPA), the Tahoe Transportation District (TTD), and Douglas County staffs were contacted to determine if their plans contained any mention of this potential future service.

- **Mobility 2035, Lake Tahoe Regional Transportation Plan, 2012.** The plan contains no reference to a Lake Tahoe gondola/tram connection to the Carson Valley.
- **Heavenly Mountain Resort Master Plan, 2007.** The master plan identifies no plan for a future gondola connection to the Carson Valley. Heavenly Ski Resort is currently updating their master plan, which will contain no plan for a Carson Valley gondola/tram connection according to Resort staff.
- **Tahoe Transportation District documents provided on website.** None of the district documents contains any reference to a future gondola/tram connection with the Carson Valley.

A number of factors were considered in identifying potential sites for the Carson Valley terminus of the gondola, including parcel location relative to the ski resort, private versus public ownership, developed versus undeveloped condition, floodplain condition, and master plan land use and zoning.

Many of the parcels in the area east of Foothill Road are in the floodplain and/or appear to exhibit wetlands conditions. Regarding land use and zoning, of the parcels in the project vicinity only the Walley and David’s parcels currently have commercial zoning. All other parcels are zoned for either Forest and Range or Agriculture.

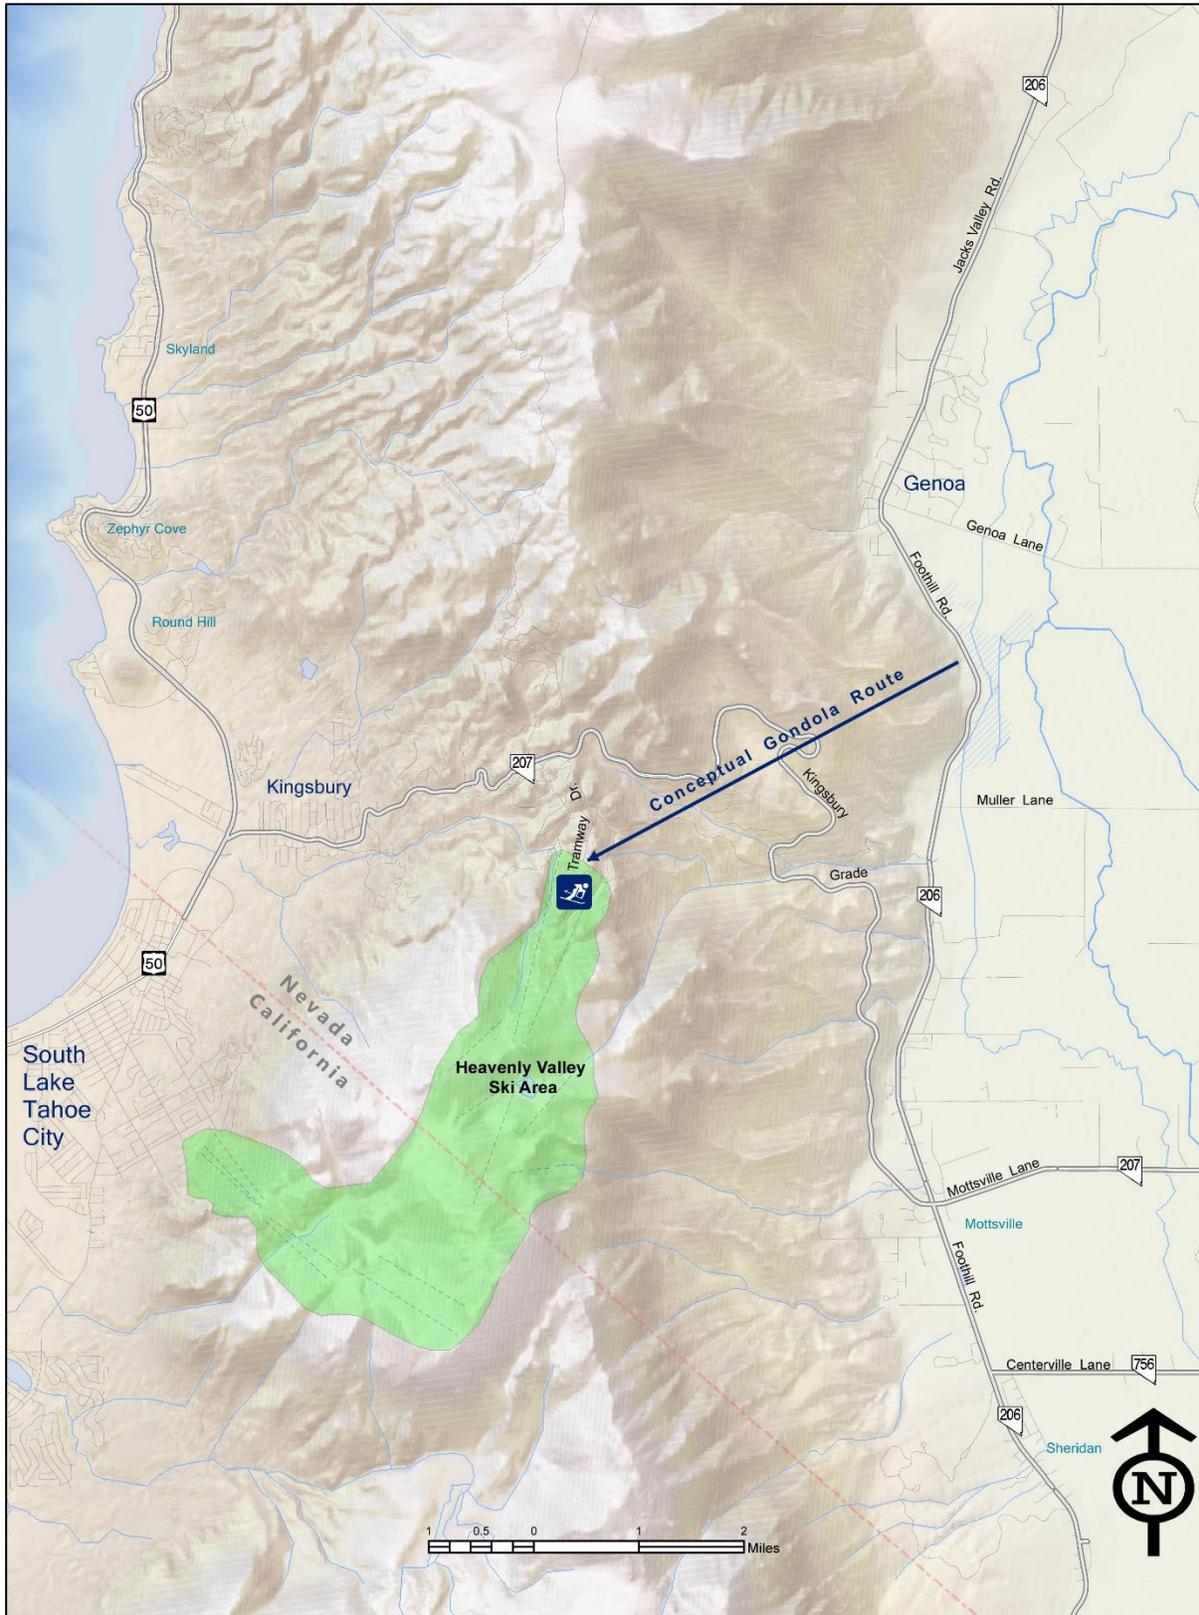

The distance traversed by the gondola as depicted is approximately three miles. The order-of-magnitude cost estimate for the gondola is \$30 million to \$35 million. The details are shown in Table 5.5.

Table 5.5: Carson Valley/Lake Tahoe Gondola Cost Estimate

CARSON VALLEY GONDOLA	COUNT	QUANTITY	UNIT OF MEASURE	COST (\$ million)
Parking lot parcel B		100	space	\$0.30
Cables	5	532	ton	\$10
Towers	5	550	ton	\$10 to \$15
Gondola cabins		28	ea	\$8
Stations with safety equipment		2	ea	\$2
Gondola Total				\$30 to \$35

Note: Cost estimate is based on unit costs from the Peak 2 Peak gondola in Whistler, BC, built in 2008

Figure 5.4: Potential Carson Valley/Lake Tahoe Gondola Route

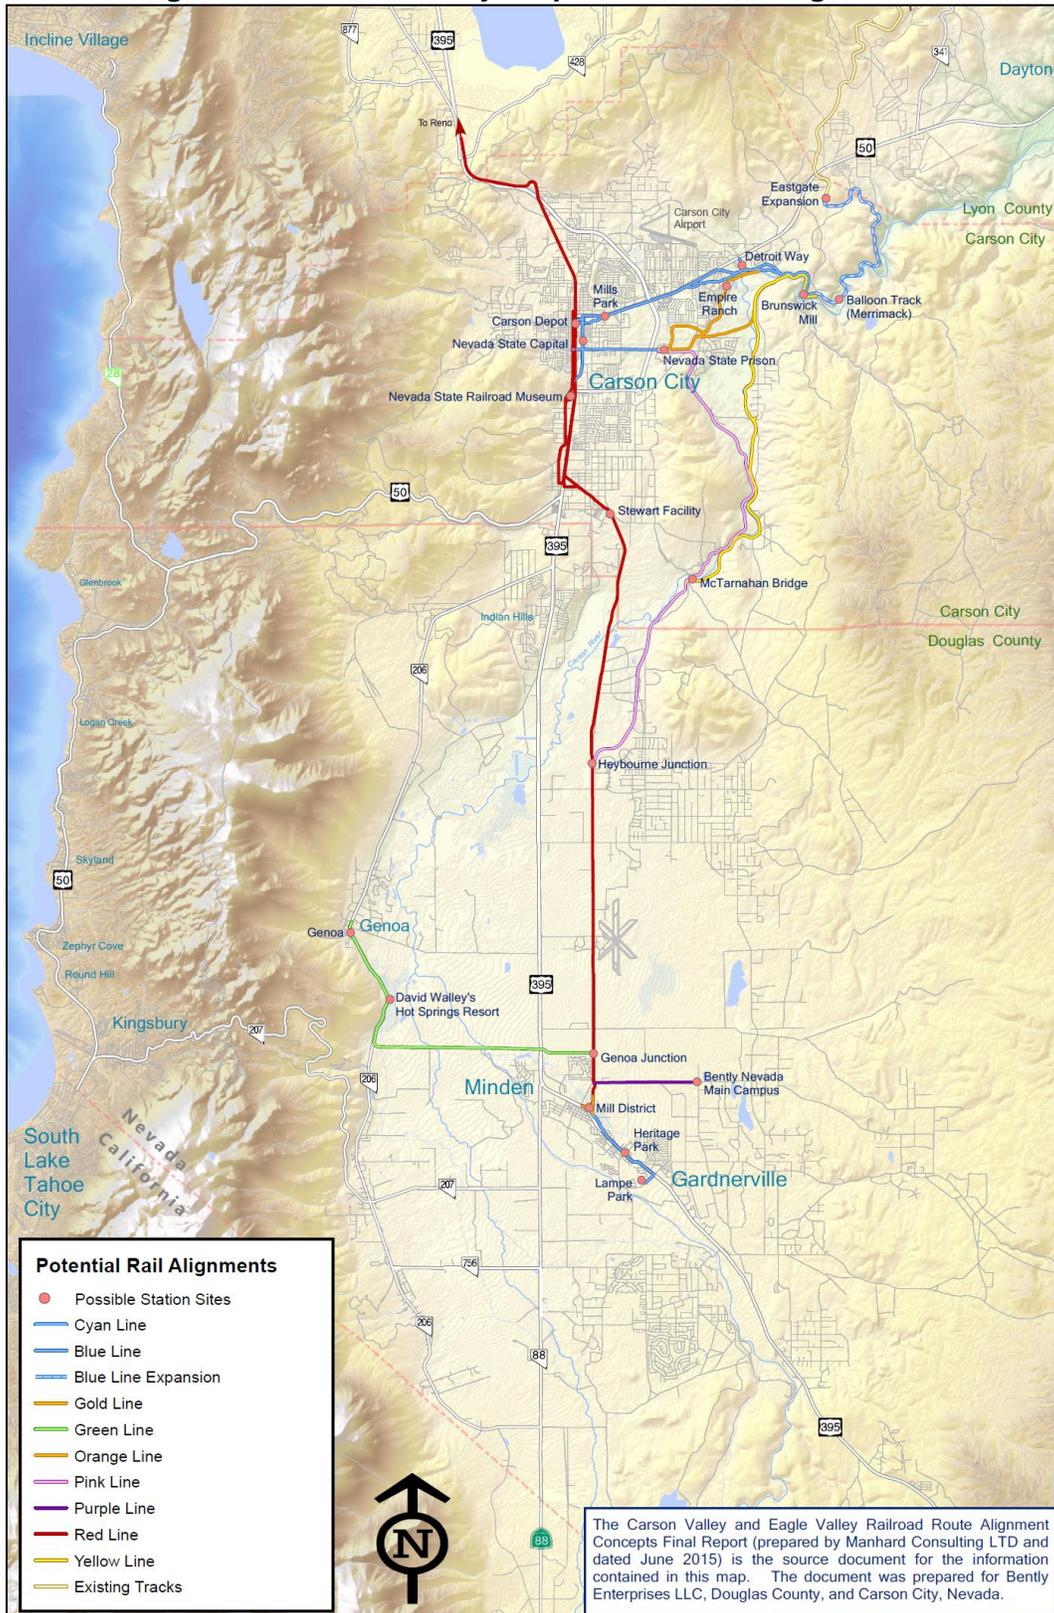

5.4.2 VIRGINIA AND TRUCKEE RAILROAD

The Virginia and Truckee (V&T) Railroad was originally incorporated in 1868, and by 1872 the railroad was in service from Virginia City to Carson City and on to Reno. In 1905, a new Virginia and Truckee Railway was incorporated to buy the assets of the V&T Railroad. This allowed the new V&T to build a 15-mile extension from Carson City south to Minden to serve the livestock and agricultural interests of the Carson Valley. The Dangbergs had considerable land holdings at the time and provided most of the right-of-way for the new extension. By 1906, the Carson City railroad shops had built an express and mail car for the new Minden Branch. Before there were paved roads, the V&T moved large numbers of cattle to the Carson Valley where they were fattened before being sent to slaughter. In the early 1920's, the State of Nevada constructed a paved highway (U.S. 395) from Reno to Minden, which started the decline of the V&T. In the 1940's, the V&T still had facilities for turning locomotives and entire trains in Minden, but by then the railroad was in serious financial trouble. The Minden Depot was featured briefly in the 1949 film *Chicken Every Sunday*, but the railroad's last revenue operating day was May 31, 1950. Removal and scrapping of the rails began almost immediately and was completed the same year. Large portions of the right-of-way were purchased by the state highway department, while other portions reverted to local ranchers.¹ Photocopies of the Virginia and Truckee Railway maps showing the railroad alignment from Minden to Carson City are provided in Appendix B.

The V&T resumed operation out of Virginia City in 1976, extending the track improvements as far as the Carson City border in 2009. It currently operates from May through October between Virginia City and Gold Hill. In recent years there has been interest in restoring operation of the V&T in the Carson Valley. In 2015, Manhard Consulting, LTD prepared the *Carson Valley/Eagle Valley Railroad Route Alignment Concepts Final Report* for Bently Enterprises, Douglas County and Carson City. This document provides potential rail alignments connecting Minden to Carson City, and also Genoa. Refer to Figure 5.5. Two alignments identified in the report provide options for light rail street cars in the Minden-Gardnerville area. The "Purple" line would connect to the main line at Heybourne Road and serve the Bently Campus area, while the "Cyan" line would serve the downtown area from Buckeye Road to Lampe Park. Key figures from the report that show potential future railway alignments in Douglas County are provided in Appendix B.

Figure 5.5: Carson Valley Proposed Railroad Alignments

2017 Douglas County Transportation Plan

5.5 Public Transportation Policies

- 5.5.1 Provide general public transit service to Douglas County residents and visitors.
- 5.5.2 Provide transit services to the elderly and persons with disabilities, as required by the Americans with Disabilities Act.
- 5.5.3 Provide regional public transit, connecting Douglas County residents and visitors with Carson City, Washoe County and Alpine County (California).
- 5.5.4 Promote use of local and regional public transit serving Douglas County residents and visitors.
- 5.5.5 Develop public transit goals and objectives to measure the transit system performance.
- 5.5.6 Annually review performance measures and indicators for existing transit services and adjust services accordingly.
- 5.5.7 Prepare a short range transit plan by 2018, including a five-year transit project list, which identifies transit needs and potential service improvements along with a financial plan.
- 5.5.8 Establish and preserve a transportation corridor in the vicinity of the former Virginia & Truckee railroad right-of-way between Minden and the Carson City line, parallel to Heybourne Road.
- 5.5.9 Evaluate the feasibility of providing rubber-tire transit service to initially serve major travel destinations as development occurs along the Heybourne Road corridor. Identify potential private and public funding sources to establish and maintain service.

5.6 Public Transportation Financial Considerations

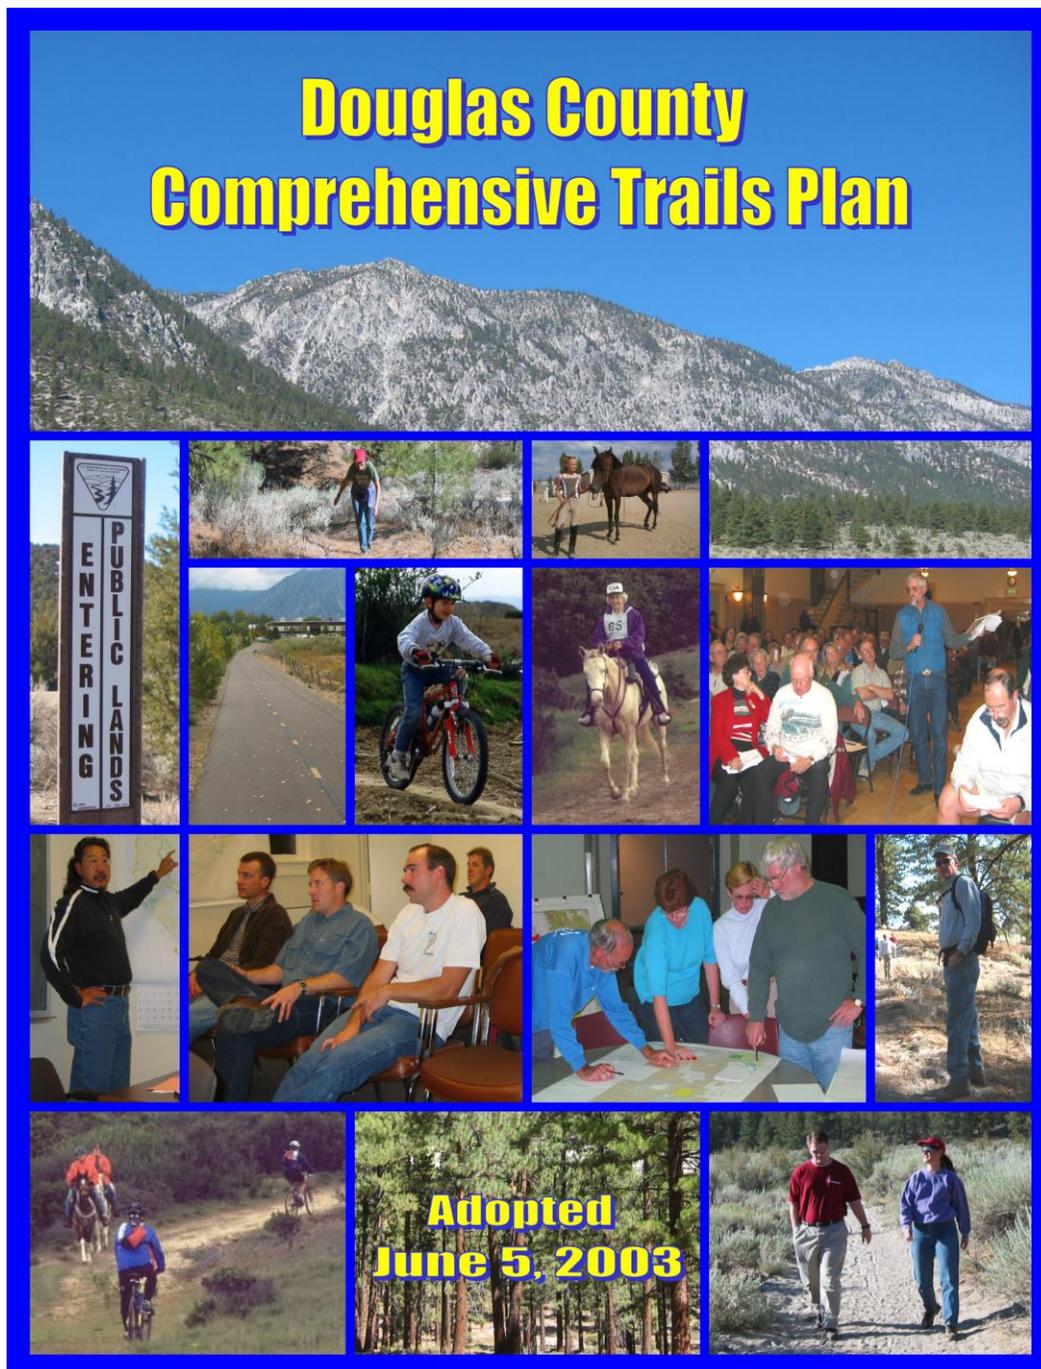

Douglas County operates the DART with funding from senior service agencies, transient occupancy tax collected outside the Lake Tahoe area, the Douglas County General Fund and various Federal Transit Administration grant programs.

The county will need to explore additional funding sources such as local sales tax, federal transit funds and partnerships with local businesses to expand services in the future. Development of a short range transit plan will aid this assessment by exploring transit services and funding options in more detail.

2017 Douglas County Transportation Plan

Chapter 6 BICYCLE/PEDESTRIAN/TRAILS ELEMENT

The *Douglas County Comprehensive Trails Plan* is a separate document identifying bicycle and pedestrian facilities, which is incorporated in its entirety into the *2017 Douglas County Transportation Plan*. The current version of this document is available on the Douglas County website.

2017 Douglas County Transportation Plan

The *Douglas County Bicycle Plan* is a separate document identifying bicycle facilities, which is incorporated in its entirety into the *2017 Douglas County Transportation Plan*. This document supplements the bicycle information contained in the Douglas County Comprehensive Trails Plan. The current version of the *Douglas County Bicycle Plan* is available on the Douglas County website.

6.1 Bicycle/Pedestrian/Trails Policies

- 6.1.1 Maintain and implement the adopted *Douglas County Comprehensive Trails Plan* to provide opportunity for non-motorized transportation within the county that meets both recreational and commuter needs.
- 6.1.2 Ensure development and maintenance of multi-purpose (hiking, equestrian, bikeway and off-road bicycle) trail systems throughout Douglas County, connecting with public lands and recreation facilities of local and regional interest.
- 6.1.3 Maintain and implement the *Douglas County Bicycle Plan*.

Chapter 7
AVIATION ELEMENT

The *Minden–Tahoe Airport Plan* is a separate document, which is incorporated by reference in its entirety into the *2017 Douglas County Transportation Plan*. The current version of this document is available on the Minden–Tahoe Airport website at www.mindentahoeairport.com. The Douglas County website has a link to the airport website.

7.1 Aviation Policies

7.1.1 Provide for safe continuation and expansion of the Minden–Tahoe Airport.

7.2 Aviation Goals

The following are goals identified in the Minden-Tahoe Airport Master Plan (AP).

- AP Goal 1: Accommodate forecast operations in a safe and efficient manner.
- AP Goal 2: Ensure that future development will continue to accommodate a variety of general aviation activities.
- AP Goal 3: Enhance and facilitate soaring while maintaining and improving safety.
- AP Goal 4: Identify the best land use types for the landside development areas.
- AP Goal 5: Foster complementary development of Airport’s environs.
- AP Goal 6: Enhance the self-sustaining capability of the Airport and ensure the financial feasibility of airport development.
- AP Goal 7: Encourage the protection of existing public and private investment in land and facilities.

Chapter 8 FINANCIAL ELEMENT

8.1 Funding for Road Maintenance

There has been a shortfall in funding for road maintenance in Douglas County for many years. In recent years the county has taken the following steps toward increasing funding:

- In 2004, a ballot initiative to implement a \$0.05 gas tax failed.
- In 2011, the Board of Commissioners approved shifting \$191,000 annually in property tax revenue from the General Fund to the Road Operating Fund.
- In 2012, the Board of Commissioners approved a goal to shift \$140,000 per year in property tax revenue from the General Fund for five years, for a total of \$700,000 annually by fiscal year 2016/2017.
- In 2013, the Board of Commissioners used priority based budgeting to shift more than \$1,000,000 per year in property tax revenue from the General Fund to the Regional Transportation Fund for preventive maintenance.
- In 2013, the Board of Commissioners directed the county manager to create a Road Funding Task Force to identify solutions to road maintenance funding challenges.

In the fall of 2013, the county manager created a task force composed of 18 members of the public who were active in the community. Public Works Department staff provided technical assistance to the task force. The task force met on a monthly basis and made several presentations to the Board of Commissioners. Their final presentation to the board was on March 6, 2014. Potential funding options identified included:

- General Fund shift of existing county-wide property taxes
 - Board discretion/budget process
- Create new road general improvement districts (GID) to fund county local roads
 - NRS 318.0953
 - Would generate new property tax revenue from areas not currently in town or GID boundaries
- Utility operator fee
 - NRS 354.59881
 - 1 percent = \$800,000 per year
 - 2.5 percent available (1 percent every other year)
- Gas tax
 - NRS 373.030
 - \$0.05 per gallon = \$900,000 per year
 - May be phased in over time

2017 Douglas County Transportation Plan

- Infrastructure tax
 - NRS 377B.100
 - 1 percent = \$800,000 per year
 - 0.25 percent sales tax = \$1,500,000
- Public transit and road maintenance tax
 - NRS 377A.030
 - 0.50 percent sales tax = \$3,000,000 per year
 - Requires voter approval

At the meeting on March 6, 2014, the Board:

- Established a policy designating county-wide taxes to be used for regional/county roads and local taxes to be used for local/neighborhood roads.
- Directed staff to identify additional funding to be shifted to road maintenance for collector roads as part of the fiscal year 2014/2015 budget process.

On December 3, 2015, the Board of Commissioners approved Ordinance No. 2015-1446, increasing its county option motor vehicle fuel tax from \$0.04 to \$0.09 per gallon on gasoline and gasohol (NRS 373.030). On that date, the Board also held a second reading of Ordinance 2015-1445. This ordinance would have imposed an additional \$0.25 sales tax with an effective date of April 1, 2016, and generated \$1,500,000 annually for infrastructure use, including a portion for road maintenance and road construction projects. However, Ordinance 2015-1445 failed on its second reading.

8.2 Financial Policies

- 8.2.1 Coordinate with the NDOT to implement capital and operational improvements on state facilities in a timely manner.
- 8.2.2 Develop funding mechanisms to implement system-wide capacity and operational system improvements to the street and highway network.
- 8.2.3 Develop funding mechanisms to maintain the existing street and highway network.
- 8.2.4 Develop funding mechanisms to implement public transportation system improvements.
- 8.2.5 Develop funding mechanisms to implement improvements to the bicycle/pedestrian/trails system.
- 8.2.6 Develop funding mechanisms to implement improvements at the Minden–Tahoe Airport.
- 8.2.7 Explore the development and implementation of a traffic impact fee program to fund regional capacity improvements on the street and highway network.

2017 Douglas County Transportation Plan

- 8.2.8 Develop and maintain a coordinated transportation plan of proposed transportation facility improvements in collaboration with adjacent jurisdictions.
- 8.2.9 Construct and maintain necessary street and road facilities in rural and urban settings to maintain a high quality-of-life in Douglas County

8.3 Funding for Proposed Transportation Projects

The total cost for projects needed to maintain the current LOS standards on Douglas County and NDOT roads through 2040 is estimated at \$741,800,000 (refer to tables 4.9 and 4.10). The Plan does not assign responsibility for these costs to any particular entity. Funding will need to be established for each project on a case-by-case basis. It is likely that each project will have funding from multiple sources. Based on past experience, potential funding sources include NDOT, Douglas County, and developer contributions. Developer contributions could include construction of improvements and/or monetary contributions.

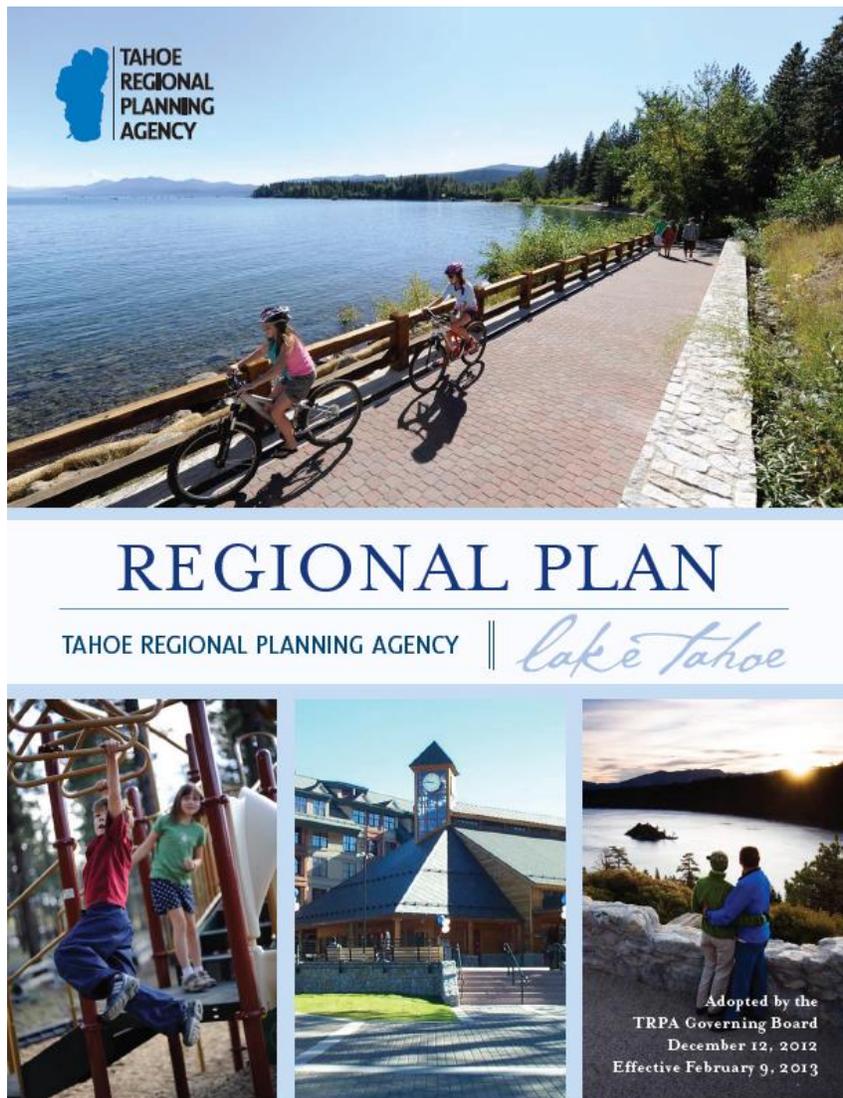

In addition to the projects needed to maintain LOS standards, the Plan also identifies projects that provide alternate local and regional access. These projects are estimated to cost \$814,500,000.

It is clear that the amount of funding required to implement the Plan is huge, and the County would need to contribute substantially to many of the projects. The County has not identified funding for construction of any of the capacity projects or alternate access projects identified in the Plan. This can be confirmed by a review of the current 5-Year Transportation Plan. To implement this Plan, the County must establish funding for the projects. Discussion of potential funding sources is beyond the scope of this document.

Chapter 9 LAKE TAHOE ELEMENT

Transportation planning in the Lake Tahoe basin involves many organizations, including the Tahoe Regional Planning Agency (TRPA)/Tahoe Metropolitan Planning Organization (TMPO), Tahoe Transportation District (TTD), Tahoe Douglas Transportation District (TDTD), and the South Shore Transportation Management Association.

The *Lake Tahoe Regional Plan* was prepared by the Tahoe Regional Planning Agency and approved in February 2013. It is a separate document that addresses transportation planning in the Lake Tahoe basin. The Regional Plan is incorporated by reference in its entirety into the *2017 Douglas County Transportation Plan*. The current version of the Regional Plan is available on the Tahoe Regional Planning Agency website.

2017 Douglas County Transportation Plan

9.1 Lake Tahoe Transportation Policies

LT T Policy 1: Participate and support the planning, design and implementation of transportation projects and transit improvements at Lake Tahoe consistent with the Tahoe Revitalization initiative of the County Economic Vitality Plan and other needs identified through the annual update of the County 5-Year Transportation Plan, County Transportation Plan, and plans of the TRPA, TMPO and TTD.

9.2 Lake Tahoe Transportation Actions

LT T Action 1.1: Douglas County shall participate with the TTD, TMPO, NDOT, City of South Lake Tahoe, Caltrans, FHWA, Nevada State Parks, and private sector stakeholders in the planning, design and implementation of the U.S. 50 Stateline Corridor/South Shore Revitalization Program.

LT T Action 1.2: Douglas County shall continue to participate in efforts to complete the Nevada Stateline-to-Stateline Bikeway Project and other identified bicycle and multi-use trail projects within Douglas County at Lake Tahoe consistent with the Tahoe Revitalization and Tremendous Trails initiatives of the County Economic Vitality Plan.

LT T Action 1.3: Douglas County shall continue to participate in the planning and implementation of transit system improvements through its representation on the Tahoe Transportation District Board of Directors.

LT T Action 1.4: Through the Tahoe Transportation District, Douglas County shall continue to explore the feasibility and potential benefits of waterborne transit at Lake Tahoe that serves the County and further supports the Tahoe Revitalization and the South Shore Plan.

LT T Action 1.5: Douglas County shall continue to participate in the community based forum of the South Shore Transportation Management Association (SS/TMA). SS/TMA plays a lead role in the development of transportation demand management and strategies to mitigate the impact of highway construction projects and special events.

Douglas County/Carson City Regional Travel Demand Model

1. INTRODUCTION

This document describes the estimation and validation of the Douglas County/Carson City Model that was developed for the counties of Douglas and Carson City in northern Nevada.

The Douglas County/Carson City Travel Demand Model (hereafter referred to as Travel Demand Model) represents an evolution of travel forecasting models and model components previously developed for Carson City and Douglas Counties.

Prior to the completion of the model calibration described in this document, a significant effort was undertaken to improve the accuracy of the planning variable database, particularly with regard to households and employment variables. This re-estimation of base year planning variables was undertaken for the 2014 timeframe based on a detailed accounting of dwelling units—available from the County Assessor’s office, and employer records—available from the Nevada Department of Employment, Training and Rehabilitation.

The Travel Demand Model covers the two counties of Douglas and Carson City. The Travel Demand Model has seven gateways representing the major roadways in and out of these two counties. The illustration which follows (Figure 1-1) provides a flow chart of the overall model structure.

The Douglas County/Carson City Travel Demand Model is designed to operate with TransCAD software, which is used by the Nevada Department of Transportation for planning projects throughout the state. TransCAD is a geographic information system (GIS) designed specifically for use by transportation professionals to store, display, manage, and analyze transportation data. TransCAD combines GIS and transportation modeling capabilities into a single integrated platform that can be used for all modes of transportation, at any scale or level of detail. TransCAD provides:

- A powerful GIS engine with special extensions for transportation
- Mapping, visualization, and analysis tools designed for transportation applications
- Application modules for routing, travel demand forecasting, public transit, logistics, site location, and territory management

TransCAD is a GIS that can be used to create and customize maps, build and maintain geographic data sets, and perform many different types of spatial analysis. TransCAD includes sophisticated GIS features such as polygon overlay, buffering, and geo-coding, and has an open system architecture that supports data sharing on local- and wide-area networks.

2. DEMOGRAPHIC INFORMATION

Zone Structure

The entire counties of Douglas and Carson City are currently being modeled by the Travel Demand Model. The Travel Demand model is subdivided into 324 internal transportation analysis zones (TAZ) and seven external stations for travel demand forecasting purposes. The resulting 331 zones are used for all travel demand forecasts.

External stations have been defined for all major roadways crossing the two counties. The following table 2-1 shows the location of the seven external stations.

Table 2-1: Location of External Gateways in the Travel Demand Model

GATEWAY/TAZ #	ROADWAY	LOCATION
1	U.S. 50	Located on the east end of Carson City
2	Goni Road	Located on the north end of Carson City
3	U.S. 395	Located on the north end of Carson City
4	Highway 28	Located on the west end of Carson City
5	U.S. 50	Located on the west end of Carson City
6	Highway 88	Located on the south end of Douglas County
7	U.S. 395	Located on the south end of Douglas County

Demographic Forecasting Needs

Travel models require a number of data items to be counted or estimated for each TAZ in the region. These items are as follows:

- **Occupied Households** are the occupied dwelling units in each TAZ. Vacant dwelling units and group quarters are not included in the household projections. “Vacant dwelling units” are determined using two variables, one representing “occupied households” and the other representing “dwelling units.” The 2010 U.S. Census information produces both of these variables. The difference between these two numbers provides the number of vacant dwelling units. Households by TAZ are the primary data used to estimate trip productions.
- **Population in Households** is used in conjunction with household data to estimate average household size for each TAZ. Population in group quarters is not included in the household population projections. Population in households is used in conjunction with households to estimate average household size for each TAZ and distributions of households by household size.
- **Median Household Income for each TAZ** has been summarized from the 2010 Census data and is expressed in 1999 dollars. This data is used to estimate distributions of households by income group for the modeling process. Income level is a strong explanatory variable for trip generation.
- **Hotel Employment** is defined as employment in the hotel industry, which is one of the planning variables in the model. Employment is defined at the work location; thus, one worker from a household might be counted as two employees if that worker held multiple

Douglas County/Carson City Regional Travel Demand Model

jobs. It is not possible to determine if a worker held more than one job using current U.S. Census data. All employment information is based on the data provided by the employer.

- ***Industrial Employment*** is defined as employment in the manufacturing industry. It includes employment in categories such as mining, manufacturing and transportation. Employment is defined at the work location. The employees are defined at the work location.
- ***Office Employment*** includes employment in finance and real estate, personal services, business services, and government. As with industrial employment, employees are defined at the work location.
- ***Retail Employment*** is defined as employment in the retail industry and includes shopping malls and specialty stores. The Retail Employment category is further subdivided into Retail-Shops, Commercial-Shops and Other-Retail. As with basic industrial employment, employees are defined at the work location.
- ***Other Non-retail Employment*** is defined as employment in the non-retail industry, like hospitals, service/industry, etc. As with basic industrial employment, employees are defined at the work location.
- ***Elementary and Middle School Enrollment (F18)*** is the student enrollment at public and private elementary and middle schools. Enrollment is defined at the school location.
- ***High School Enrollment (F912)*** is the student enrollment at public and private high schools. Enrollment is defined at the school location.
- ***College Enrollment (F13)*** is the student enrollment at public and private colleges. Both part-time and full-time students are included. Enrollment is defined at the school location.

In addition to the above data items, the number of internal-external vehicle trips at each external station is projected. The internal-external trips include all trips inbound to the study area and outbound from the study area, but exclude all through trips (not stopping in the study area). Through trips, being a very small percentage of all the external trips, are not specified in the model. The estimates of internal-external trips included with the Travel Demand Model are consistent with existing counts for the base year. Estimates of future year internal-external trips were developed based on population growth for that appropriate year.

Base Year (2014) Socioeconomic Data Summaries

The base year data for households was obtained from the County Assessor's office and city records. This information at the parcel level was aggregated to the TAZ level for the Carson City and Douglas County area. Year 2014 Department of Employment, Training, and Rehabilitation (DETR) data for employment information was obtained from the Nevada DETR. Median household income data from the Year 2000 Census data at the block group level was appropriately distributed at the TAZ level.

The Travel Demand Model was divided into three jurisdictions based on county boundaries as shown in Figure 2-1. Table 2-2 reports the base year summaries by jurisdictions. Jurisdiction 1 represents Carson City, Jurisdiction 2 represents Douglas County, and Jurisdiction 3 represents the external stations.

*Data is from year 2005. No data is available for year 2014.

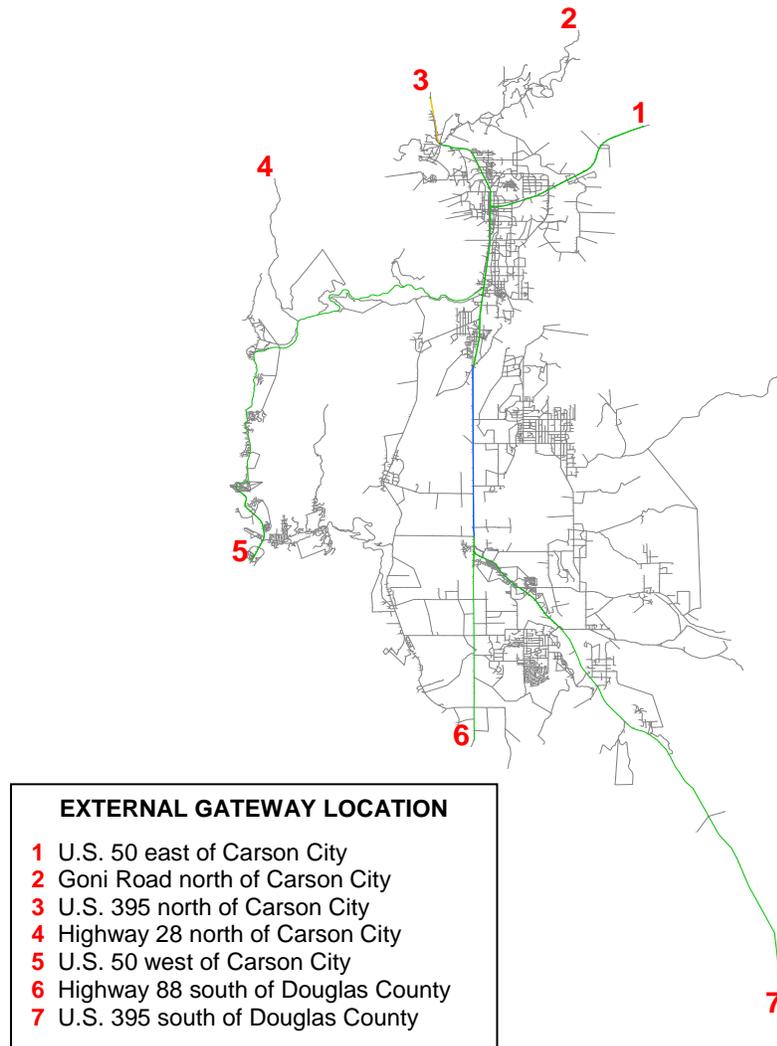

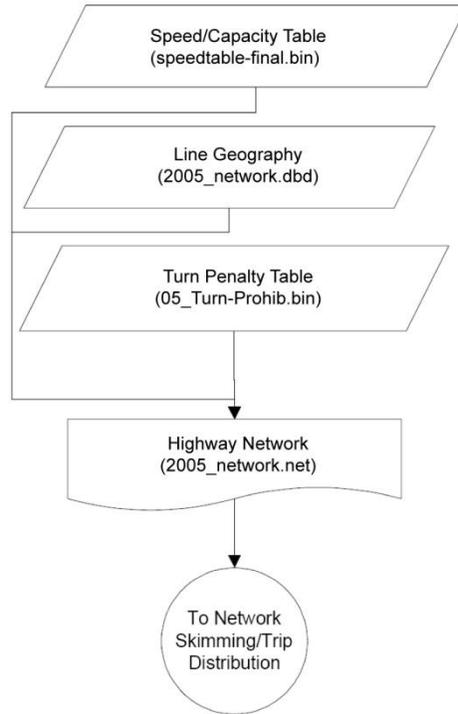

Figure 2-2: External Gateway Locations for the Travel Demand Model

3. HIGHWAY NETWORK

Network Development

Transportation Analysis Zones and Highway Geographic Database

Both the highway network and the transportation analysis zones (TAZ) are based on a 331 zone structure. Of these zones, zone numbers 1 to 7 are external zones and zone numbers 8 to 331 are internal zones. The TAZ geography is included as a TransCAD geographic database in the model. However, this database is not used in any model run. The TAZ geography exists so that users can link model inputs and outputs (e.g. demographics and output trips) to the files and view results geographically. TransCAD uses the zone network in conjunction with the highway network to assign trips from the zones to the highways.

The highway network is represented as a GIS geographic file. Both the attributes and the geography of the network are maintained in the TransCAD GIS. The geographic file uses shaping between nodes to accurately define both the true geography and true distances of the network links. The geographic shape of the street segments are derived from the Carson City and Douglas County GIS streets file, aerial images and TIGER/Line files.

Network attributes include roadway classification type, area classification types, segment lengths and other road design-based attributes which are used for classification of free-flow speeds and capacities. Another set of attributes are free flow speed, alpha, beta and capacity exceptions for individual links, which can be used to override the default values that are applied on a global basis. These values are variables used in the trip distribution equations. A full listing of the network attributes is listed in Table 3-1.

Douglas County/Carson City Regional Travel Demand Model

Table 3-1: Network Attributes

FIELD_NAME	DESCRIPTION
ID	* unique Link Identification Number
Length	* Length of the link in miles
Dir	* one-way or 2-way links (Dir 0 = 2-way link, Dir 1 = 1-way link)
NAME	* Street Name
FTYPE_NUM	* Integer form of the Functional Class of a link
FTYPE_NAME	* Type of Functional Class
ATYPE_NUM	* Integer form for Area Type
ATYPE_NAME	* Description of Area Type (i.e. suburban, rural, etc.)
AB_LANES	* Number of Lanes on AB Direction of Link
BA_LANES	* Number of Lanes on BA Direction of Link
UNIT	* Must have a Value of 1
DAY_LANE_CAP	Daily Capacity per Lane
HOUR_LANE_CAP	Hourly Lane Capacity
AB_SPEED	Free-flow Speed on AB Direction of Link (mi/hr)
BA_SPEED	Free-flow Speed on BA Direction of Link (mi/hr)
ALPHA	BPR Coefficient
BETA	BPR Exponent
ALT_BETA	Alternative BPR Coefficient for a link
ALT_CAP	Alternative Capacity for a link
ALT_SPEED	Alternative Speed for a link
AB_TIME	Free Flow Travel Time in AB Direction of Link (computed as Length/AB_SPEED * 60)
BA_TIME	Free Flow Travel Time in BA Direction of Link (computed as Length/BA_SPEED * 60)
AB_TIME_PK	For First Iteration =*Time, else time is AMPEAK
BA_TIME_PK	For First Iteration =*Time, else time is AMPEAK
AB_TIME_OPK	For First Iteration =*Time, else time is OFFPEAK
BA_TIME_OPK	For First Iteration =*Time, else time is OFFPEAK
AB_TIME_AVG	For First Iteration =*Time, else Weighted Average of (AMPEAK, PMPEAK & OFFPEAK)
BA_TIME_AVG	For First Iteration =*Time, else Weighted Average of (AMPEAK, PMPEAK & OFFPEAK)
AB_HR_CAP	One Hour Link Capacity
BA_HR_CAP	One Hour Link Capacity
AB_10HR_CAP	Offpeak Capacity is equal to 10* Hour Link Capacity
BA_10HR_CAP	Offpeak Capacity is equal to 10* Hour Link Capacity
AB_DAY_CAP	Daily Link Capacity
BA_DAY_CAP	Daily Link Capacity
AB_COUNT_AMPeak	** am peak hour Counts
BA_COUNT_AMPeak	** am peak hour Counts

Field names denoted with a “*” are required fields for the model. Field names denoted with a “**” are required only in the model option that compares count information with model flow results.

The highway network also contains 2014 traffic counts compiled by Parsons that were obtained primarily from NDOT. Both hourly and daily 2014 base year Annual Average Daily Traffic (AADT) counts were taken. This data was entered into the highway network input files for model validation, providing a comparison between counts and model forecasts. For more information, see page A-1 of Appendix A in the traffic model report. All hourly counts are based on 2014 estimates and only weekday counts were included.

Node Attributes

In TransCAD, nodes are an additional layer in the highway geographic database with unique ID's and optional attribute fields. In the Travel Demand Model, the first 331 node IDs are designated as the centroids. There is also a field in the nodes called “TAZ” that has the traffic analysis zone number for centroids nodes.

Highway Network (.NET) Creation

From this line geographic file, a TransCAD network is created. The network uses the fields LENGTH, FTYPE_NUM, *TIME, *_HR_CAPACITY, *10HR_CAPACITY, ALPHA, and BETA. Centroids have also been set in this network. The model includes a button that automatically recreates the highway network. The model also has a supplementary input file (speed-capacity lookup table), which is used to help create the network. The values of this speed-capacity lookup table are documented in Tables 3-2 and 3-3. Table 3-4 represents the cross-classification lookup value for the Facility and Area types

Douglas County/Carson City Regional Travel Demand Model

Table 3-2: Hourly Capacities (vehicles per hour per lane) Used for the Travel Demand Model

FUNCTIONAL CLASS	AREA TYPES		
	CENTRAL BUSINESS DISTRICT (CBD)	URBAN	RURAL
System ramps	2,000	2,000	2,000

Douglas County/Carson City Regional Travel Demand Model

The speed-capacity lookup table automatically fills in link speeds, hourly and daily lane capacities and link alpha and beta values by functional classification and area type. By matching up the FTYPE_NUM and ATYPE-NUM fields in the network with this lookup table, the model automatically fills in the following fields: DAY_LANE-CAP, HOUR_LANE_CAP, AB_SPEED, BA_SPEED, AB_TIME, BA_TIME, ALPHA, BETA, AB_HR_CAP, BA_HR_CAP, AB_10HR_CAP, BA_10HR_CAP, AB_DAY_CAP and BA_DAY_CAP. The model also uses the fields AB_LANES, BA_LANES and UNIT as inputs network fields. Appendix A describes all of the fields in this table.

Turn Penalties Table

A turn penalties file is also included within the model stream. The turn penalties file is based on nodes and reflects, on a from-link to to-link basis, prohibitions and delays from certain turn movements from occurring during the traffic assignment process. The turn penalties are embedded into the network during network creation and affect the highway skimming and highway assignment sections of the model. Skim is a unit of measurement (time, distance, cost, etc.) between two TAZ. The following table describes the fields of the table:

Turn Penalties Table (xx_Turn-Prohib.bin)*

Field	Description
FROM_ID	From Link ID
TO_ID	To Link ID
PENALTY	Penalty Value, missing value denotes a prohibition

Base Year Network Road Classification

Figure 3-1 illustrates the classification of roadways coded in the Year 2014 Highway Network. The roadway network was developed from scratch using the TIGER files as a starting point and refining the roadway classifications as appropriate. This roadway network along with the roadway classification was used for the model development and validation purposes. Because of the technical requirements of the travel demand model, this map shows a slightly different functional classification network than the Douglas County map.

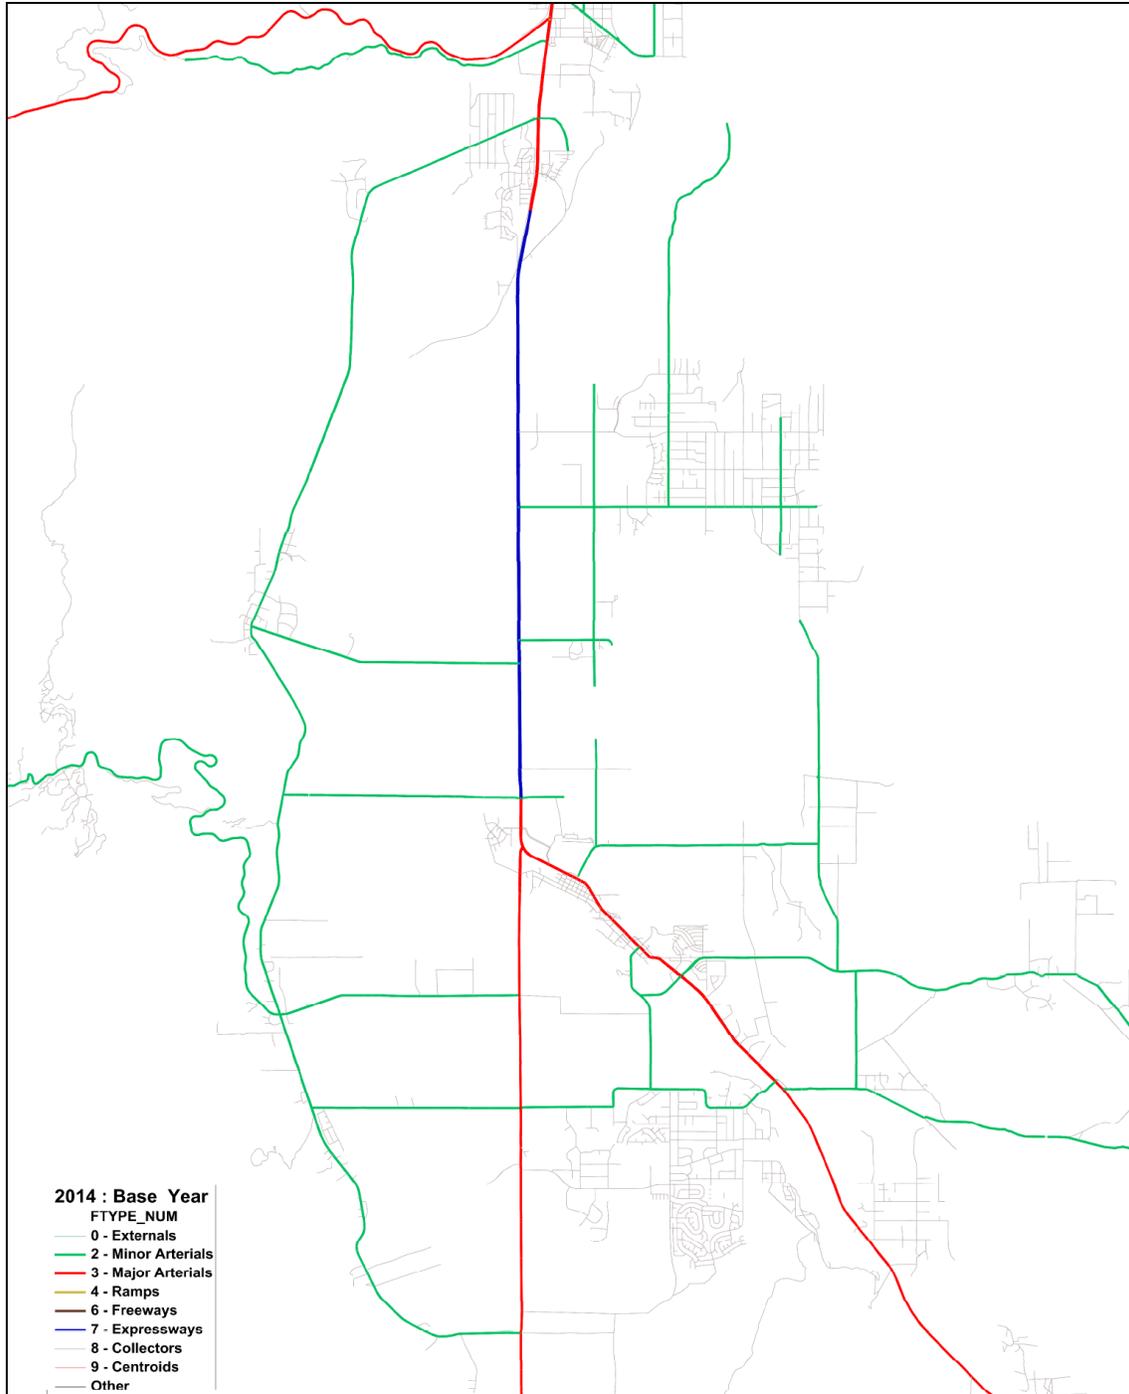

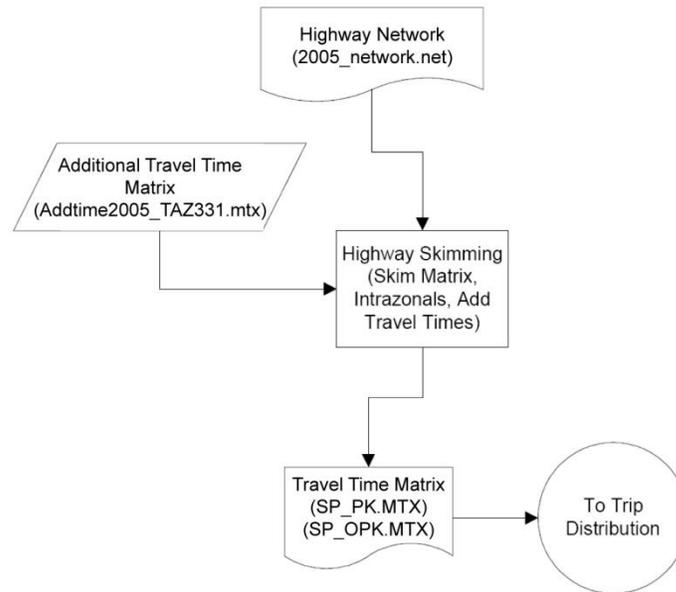

Figure 3-1: Year 2014 Douglas County and Carson City Highway Network

Highway Skims

Once the highway network is created, the model performs highway skims from centroid node to centroid node. The travel time is “minimized” and travel distance is skimmed. Both the offpeak and peak travel periods (8:00–9:00 a.m. and 5:00–6:00 p.m.) are skimmed as input to the downstream models. To calculate the offpeak skims, free-flow travel times are used, which are derived from the formula: $\text{GIS Length/Free-Flow Speed} * 60$. To calculate the peak skims, congested travel times are used. Congested travel times are calculated from the output of previous traffic assignments and are described in more detail in the Assignment section of this document.

After the peak and offpeak travel time matrices are calculated, intrazonal travel times are calculated and then origin and terminal times are added to them. The procedure used for calculating intrazonal travel times was the closest neighbors approach. For each row origin, the travel time to its two closest neighbors is found from the matrix. The intrazonal time is computed as one half of the travel time to its closest neighbor.

After intrazonal travel times are estimated, additional origin and terminal times of 4 minutes are added to the skim matrix.

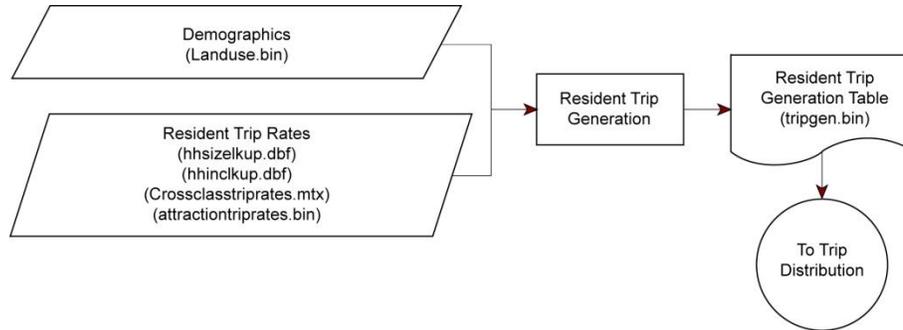

The highway skims proceed in the following manner:

1. The highway database and network are opened and nodes that are centroids are selected.
2. A travel time matrix from centroid to centroid is calculated using the peak and offpeak skims.
3. Intrazonal times taking into account nearest adjacent neighbor times are calculated.
4. Origin and terminal times are added to the matrix.

Descriptions of the input and output files and parameters can be found in Appendix A.

4. TRIP GENERATION

Resident Model Set

Overview

The resident trip generation models that were recently estimated and calibrated for the Clark County area were used as the starting point for the trip generation and calibration. The trip production models are cross-classification models stratified by income group and household size. In effect, the models provide trip production rates by trip purpose for each household size, income group stratum. The independent variable used is the number of households in the stratum. Five household size strata are used:

- 1 person households
- 2 person households
- 3 person households
- 4 person households
- 5 or more person households

The travel model uses four household income groups, consistent with the 2000 U.S. Census income categories. All incomes are represented in 1999 dollars:

- Low income (Less than \$19,999)
- Lower-middle income (\$20,000 to \$29,999)
- Upper-middle income (\$30,000 to \$49,999)
- High income (\$49,999 or more)

It is necessary to estimate a joint distribution of households by income group and household size (*i.e.*, 20 separate cells) for each TAZ. Submodels (documented below) are provided to produce these data from normal socioeconomic information forecast for each TAZ: population in households, number of households, and median income. As income increases, the rate of auto ownership and trip generation increases.

The trip attraction models are cross-classification-like models with number of employees by employment by type and households being the explanatory variables. The employment and household data are normally forecast by TAZ.

Douglas County/Carson City Regional Travel Demand Model

The resident trip generation models have been developed for the following trip purposes:

- Home-Based Work (HBWork)
- Home-Based School (HBSchool)
- Home-Based Shop (HBSHOP)
- Home-Based Other (HBOther)
- Non-Home-Based (NHB)

All trip rates documented herein are based on total person trips made in motorized vehicles. Person trips made using non-motorized modes such as walk, wheelchair, or bicycle and person trips made using unspecified modes were not included in the data used to estimate the trip rates.

Socioeconomic Submodels

Socioeconomic submodels were developed from 2000 Census data to estimate the number of households by income group and household size for each TAZ. Three submodels were developed:

- A submodel to estimate the number of households by household size based on the average household size of the TAZ and the number of households in the TAZ.
- A submodel to estimate the number of households by income group based on the ratio of the median income for the TAZ to the regional median income and the number of households in the TAZ.
- A submodel to estimate the joint distribution of households by income group and household size based on the results from the above two submodels.

Year 2000 Census Data

Data for Douglas County and Carson City were estimated based on Year 2000 Census information. Table 4-1 shows the summary of the household information. The information for persons per household and number of households in certain income ranges was extracted from the dataset, which contained 64 block groups. The block group data have been used to estimate household size and income group submodels for use in the trip generation modeling process. The regional median income is based on the 2000 U.S. Census information for both Douglas County and Carson City. This data reveals that one-half of the households have an income less than \$44,448 and the other half of the households have an income above this figure. The household population includes everybody living in the household regardless of their age. Table 4-1 has been revised to clarify the total households in both subsets.

The Households Size Disaggregation and Household Income Disaggregation Submodels were borrowed from the 2004 Las Vegas RTC Travel Demand Model recently developed by Parsons for the Las Vegas metropolitan area. This model also used data from the existing Carson City model. The joint distributions of households by household size and household income was, however, calibrated to the 2000 Census information for the counties of Douglas and Carson City. Table 4-2 presents the 2014 data for Douglas County and Carson City.

Douglas County/Carson City Regional Travel Demand Model

Table 4-1: Douglas County and Carson City—2000 Census Data Summary

CATEGORY	UNITS
Population	93,716
1 person households	9,010
2 person households	14,055
3 person households	5,700
4 person households	4,746
5+ person households	<u>3,154</u>
Total occupied households	36,665
Households with income less than \$19,999	6,472
Households with income between \$20,000 and \$29,999	4,374
Households with income between \$30,000 and \$49,999	8,893
Households with income greater than \$49,999	<u>16,926</u>
Total occupied households	36,665

Table 4-2: Douglas County and Carson City—2014 Data Summary

CATEGORY	UNITS
Population	102,079
1 person households	10,082
2 person households	15,697
3 person households	6,353
4 person households	5,328
5+ person households	<u>8,525</u>
Total occupied households	40,984
Households with income less than \$19,999	7,213
Households with income between \$20,000 and \$29,999	4,877
Households with income between \$30,000 and \$49,999	10,000
Households with income greater than \$49,999	<u>18,894</u>
Total occupied households	40,984

Households by Household Size Disaggregation Submodel

The hypothesis underlying the household size disaggregation model is that for any given zonal average household size (*i.e.*, persons per household) there is a specific “mix” of households for each integer household size (*i.e.*, one person households, two person households, etc.). In order to implement this hypothesis as a functional model, household data from the 2000 Census were summarized and grouped by average household size. This summarization was performed at the census block group level with data grouped by ranges of 0.1 persons per dwelling unit (for example, 1.0 to 1.04 were grouped to the 1.0 range, 1.05 to 1.14 were grouped to 1.1, 1.15 to 1.24

Douglas County/Carson City Regional Travel Demand Model

were grouped to 1.2, etc.). The summarized data showed a reasonable relationship between average household size and the distribution of the integer persons per household when they were plotted.

A preliminary model was developed by “hand-fitting” curves to the census data. These non-linear, hand-fitted curves were not an adequate model since the percent of integer households did not necessarily meet two essential criteria. These two criteria were:

- The sum of the integer household percents equal 100.0 for each average household size
- The average persons per household calculated from the integer household percents equal the average household size being used as the independent variable.

Each average household size range was investigated to ascertain the change required in the integer household size percents to meet the above two criteria. The curves were then redrawn and smoothed to produce a usable household size disaggregation model. The final model is shown in Figure 4-1 and Table 4-3.

1.00 – 3.49	5.6
3.50 – 3.50	5.8
4.00 or more	6.0

Households by Income Group Disaggregation Model

The income group disaggregation model is similar in form to the household size disaggregation model. The independent variable for the model is the ratio of the TAZ median income to the regional median income. The model was estimated using block level data from the 2000 Census. The income ranges defined by the Census for the block group data that was used for the income group disaggregation model are shown in the Table 4-4. The regional median income in 1999 dollars and median incomes for each of the block groups were also obtained from the block group data.

Table 4-4: Household Income Classification

INCOME GROUP	2000 CENSUS INCOME RANGE USED (1999 DOLLARS)	HOUSEHOLDS IN RANGE (2000 CENSUS)	
		NUMBER	PERCENT
Low	Less than \$19,999	6,472	17.6%
Lower-middle	\$20,000–\$29,999	4,374	11.9%
Upper-middle	\$30,000–\$49,999	8,893	24.3%
High	\$50,000 or more	16,926	46.2%

For future forecasts, median incomes can be left unchanged in stable TAZs. For TAZs that are developed or redeveloped between the base and forecast years, TAZ median incomes can be estimated from similar TAZs. Future year income forecasts can be in 1999 or future year dollars. The effect of changing the base year for income forecasts will be accounted for by using the ratio of the TAZ median income to the regional median income. In effect, the income group disaggregation model is “self-correcting” for changes in real or inflationary income.

The ratios of the TAZ median incomes to the regional median income and the proportions of households in each of the four income groups were calculated for each block group. Four curves were then developed for the income group disaggregation submodel to represent the proportions of households within the income ranges for each value of the income ratio. The proportions defining the curves were constrained to sum to 1.0 for each value of the income ratio. In addition, the curves were defined such that the implied TAZ median income would fall in the income group implied by the input income ratio. For example, if the input TAZ median income is \$31,200, the TAZ to regional median income ratio is 0.7. The income group disaggregation model, a total of 48.1 percent of the households would have incomes in the low and lower-middle income group ranges. The lowest 5.96 percent of the 31.9 percent of the households in the upper-middle income range (*i.e.*, 1.9 percent of all households in the region) would also have incomes less than \$31,200. If incomes in the upper-middle income range are assumed to be uniformly distributed (an unlikely case), the implied median income for the TAZ would be 5.96 percent of the range from \$30,000–\$49,999, or \$31,192. Table 4-5 and Figure 4-2 show the income group disaggregation model.

¹ Since the median income falls in the high income group and the maximum income for that group is undefined, the implied median income cannot be estimated.

Douglas County/Carson City Regional Travel Demand Model

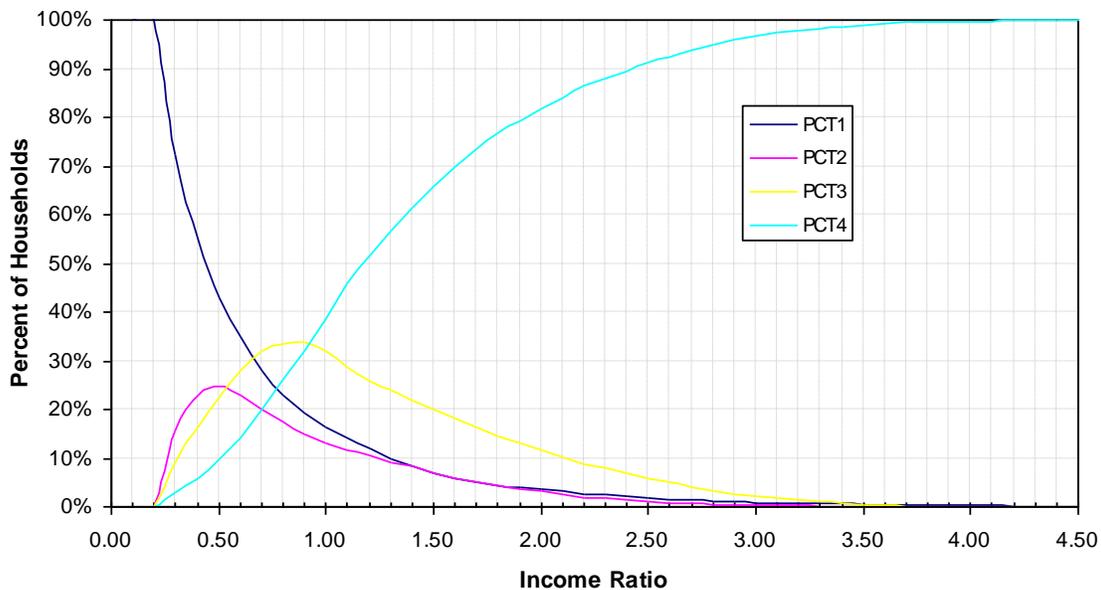

Figure 4-2: Income Group Disaggregation Submodel

Estimating Joint Distributions of Households by Socioeconomic Strata

The two submodels described in the previous sections result in *preliminary* estimates of the following “univariate,” or “marginal,” distributions of households for each TAZ:

- Households by household size
- Households by income group

The initial applications of the models result in preliminary estimates for the following reason. If the households are summed over the strata included in each univariate distribution for each TAZ, the total will be the number of households for the TAZ. For example, if the estimated households by household size are summed for TAZ 1, the total will be the number of households in TAZ 1.

To ensure that the regional sums match, a marginal weighting, or *fratar*, process can be applied on a regional basis. For this application, the input “matrices” are the estimates of households for each TAZ in the region from the preliminary applications of the household size or income group disaggregation submodels. The marginal distributions for this application of the marginal weighting process are the total numbers of households for each TAZ and the estimated regional households for the socioeconomic stratum being factored—regional households by household size or regional households by income group. The results of this marginal weighting step will ensure that the total numbers of households for each TAZ are correct when the various socioeconomic distributions are summed by TAZ, and that the regional households by socioeconomic stratum are correct when the households for the stratum are summed across all TAZs. Regional distributions of households by income group *and* household size are used to develop the regional control totals for households.

A third submodel completes the disaggregation and results in estimates of households jointly stratified by income group and household size for each TAZ. The submodel uses the results from the modified marginal distributions of households by income group and households by household size for each TAZ along with the regional joint distribution of households by income group and

Douglas County/Carson City Regional Travel Demand Model

household size (Tables 4-6 and 4-7). The final joint distributions are shown in Tables 4-5 and 4-6 and were developed by updating the joint distributions that was developed for Clark County. The Clark County joint distribution is based on the Public Use Micro Sample (PUMS) data from the 2000 Census, which is a one percent sample of all households for a given county. The Clark County estimates for the joint distribution was then frateded to match the marginals that were obtained for the 2000 Census for Douglas County and Carson City by household size and income group. The median income for each TAZ was derived from the 2000 Census block group data and is represented in 1999 dollars.

Table 4-6: Households by Income Group and Household Size

INCOME GROUP	HOUSEHOLD SIZE					TOTAL
	1	2	3	4	5+	
Low	3,689	1,481	640	391	270	6,472
Low-middle	1,483	1,756	523	389	224	4,374
Upper-middle	2,269	2,654	1,393	986	681	8,893
High	1,569	7,163	3,234	2,981	1,979	16,926
Total	9,010	14,055	5,700	4,746	3,154	36,665

Table 4-7: Proportion of Households by Income Group and Household Size

INCOME GROUP	HOUSEHOLD SIZE					TOTAL
	1	2	3	4	5+	
Low	10.1%	4.0%	1.7%	1.1%	0.7%	17.7%
Low-middle	4.0%	4.8%	1.4%	1.1%	0.6%	11.9%
Upper-middle	6.2%	10.0%	3.6%	2.7%	1.9%	24.3%
High	4.3%	19.5%	8.8%	8.1%	5.4%	46.2%
Total	24.6%	38.3%	15.5%	12.9%	8.6%	100.0%

The third submodel effectively fratars the regional joint distribution of households by income group and household size on a TAZ-by-TAZ basis to match the modified marginal distributions of households by income group and households by household size for each TAZ. All three submodels have been coded in TransCAD GISDK scripts for automatic application each time the trip generation module is invoked.

Socioeconomic Model Application Summary

In summary, the process for estimating the number of households for the joint distribution of households by income group and household size for each TAZ makes extensive use of the marginal weighting technique. The process is as follows:

- Preliminary estimates of the number of households by income group and households by household size are developed for each TAZ using the appropriate socioeconomic disaggregation submodel.

Douglas County/Carson City Regional Travel Demand Model

- The preliminary estimates of households for each marginal socioeconomic distribution for each TAZ are marginally weighted so that the numbers of households for each TAZ and the total numbers of households for each socioeconomic group for the region are matched.
- The regional distribution of households by income group and household size are marginally weighted to match the estimated marginal distributions of households by income group and household size on a TAZ-by-TAZ basis.

All three submodels have been coded in TransCAD GISDK scripts for automatic application each time the trip generation module is invoked.

Trip Production Models

Trip production models were borrowed from the Las Vegas region and were estimated using a traditional cross-classification analysis. Purpose specific person trips made in motorized vehicles were summarized for each household and average trip rates per household were then calculated for all households within defined socioeconomic strata. As outlined in the socioeconomic data section above, two household characteristics, household size and income group, were used to define the household strata. As income becomes greater, the rate of auto ownership and trip generation generally increases. However, larger household size causes a greater increase in trip generation rates than rising income levels. These submodels were further refined to better represent Douglas and Carson City.

Home-Based Work Trip Production Model

Table 4-8 shows the Home-Based Work trip production model for the region. Based on strict statistical comparisons of trip rates, some combining of cells could have been performed. However, the increase in trip rates as household size increased and as income group increased was very reasonable.

Table 4-8: Home-Based Work Trip Production Model

INCOME GROUP	HOUSEHOLD SIZE				
	1	2	3	4	5+
Low	0.34	0.71	0.76	1.67	2.00
Lower-middle	0.65	1.07	1.46	1.79	2.27
Upper-middle	0.88	1.37	1.96	2.13	2.40
High	0.95	1.89	2.26	2.39	2.64

Home-Based School Trip Production Model

Table 4-9 shows the HBSchool trip production model for the region. Shading of cells shows the trip rate combinations performed as part of the model estimation. The HBSchool trip production model shown in Table 4-9 is for trips made in motorized vehicles to all:

- Pre-schools and kindergartens
- Elementary schools, middle schools, and high schools
- Community colleges and vocational/technical schools.

Table 4-9: Home-Based School Trip Production Model

INCOME GROUP	HOUSEHOLD SIZE				
	1	2	3	4	5+
Low	0.01	0.27	0.48	0.95	3.11
Lower-middle	0.01	0.02	0.48	0.95	3.11
Upper-middle	0.01	0.02	0.48	1.77	3.11
High	0.01	0.14	0.48	1.77	3.11

The trip rates shown in Table 4-9 tend to vary more by household size than by income group. This is logical since HBSchool trips are primarily dependent on the presence of school-age children in a household, which should be highly correlated with household size. The very low rate for one-person households reflects a small number of single person households where the householder is a student. The difference between trip rates for low and lower-middle income, two person households probably reflects the impact of single-parent households. Specifically, low income, two-person households are probably more likely to be “single parent with a child” households, while two (working) adults are more likely to comprise two-person, lower-middle and upper-middle income households.

The HBSchool trip production model shown in Table 4-9 has sensitivity to household structure. In other words, since the model is stratified by household size, it is sensitive to changes in household size—the increase or decrease in number of children in a household. Nevertheless, the total HBSchool productions should be compared to the total attractions based on enrollment projections. If a large imbalance is noted, an inconsistency between forecast population and households, and forecast school enrollment is possible.

Since only person trips made in motorized vehicles have been summarized in the trip rates shown in Table 4-9, behavior regarding the propensity to walk or bicycle to school is assumed to remain constant over time. This assumption is consistent with the assumption made when HBSchool trip attractions are forecast based on school enrollment.

Home-Based Shop Trip Production Model

Table 4-10 shows the HBShop trip production model for the region. Shading of cells shows the trip rate combinations performed as part of the model estimation. Again, the trip rates tend to vary by household size, but not income group, and for this purpose, the variation in trip rates across two-, three-, and four-person households was not significant. The lack of variation across income groups is generally logical. Households need to shop for basic necessities regardless of income. Income is a primary determinant of whether shopping takes place at a high-end retail store or a discount store.

Table 4-10: Home-Based Shop Trip Production Model

INCOME GROUP	HOUSEHOLD SIZE				
	1	2	3	4	5+
Low	0.36	0.92	0.92	0.92	1.59
Lower-middle	0.54	0.92	0.92	0.92	1.59
Upper-middle	0.54	0.92	0.92	0.92	1.59
High	0.54	0.92	0.92	0.92	1.59

Douglas County/Carson City Regional Travel Demand Model

The lack of variation across household size is also reasonable. The two-person household rate is about twice the one-person household trip rate, reflecting an increased tendency for both household members to shop together. However, for three- and four-person households, no significant increase in the trip rate was observed. This reflects the fact that, quite often, not all household members are required for the “shopping trip.” In a three- or four-person household, this would indicate the tendency for only one extra household member to participate in the shopping trip.

Home-Based Other Trip Production Model

Table 4-11 shows the HBOther trip production model for the region. Shading of cells shows the trip rate combinations performed as part of the model estimation. The variation in trip rates across household sizes is reasonable. In addition, some variation in trip rates across income groups might reflect the influence of additional disposable income, allowing for additional trips to be made (see also the NHB trip rates).

Table 4-11: Home-Based Other Trip Production Model

INCOME GROUP	HOUSEHOLD SIZE				
	1	2	3	4	5+
Low	1.46	2.68	3.63	5.83	6.54
Lower-middle	1.46	2.68	3.63	5.83	6.54
Upper-middle	1.46	2.68	3.63	5.83	6.54
High	1.46	2.68	4.76	5.83	10.44

Non-Home-Based Trip Production Model

Table 4-12 shows the NHB trip production model for the region. Shading of cells shows the trip rate combinations performed as part of the model estimation. The variation in trip rates across household sizes is reasonable. In addition, the variation in trip rates across income groups probably reflects the influence of additional disposable income allowing for additional trips to be made (see also the HBOther trip rates).

The NHB trip production model is applied only to obtain a regional control total for NHB trips. The locations of the actual trip productions are determined using an allocation model. For the Douglas County and Carson City region, the NHB trip attraction model is used as the allocation model (in effect, NHB productions are set equal to NHB attractions on a TAZ-by-TAZ basis after the NHB attractions are scaled to match the regional total NHB productions).

Table 4-12: Non-Home-Based Trip Production Model

INCOME GROUP	HOUSEHOLD SIZE				
	1	2	3	4	5+
Low	0.85	1.43	2.36	2.96	2.96
Lower-middle	1.70	1.43	2.36	2.96	2.96
Upper-middle	1.70	2.51	2.36	4.93	4.93
High	2.39	2.51	3.25	4.93	4.93

Trip Attraction Models

The trip attraction models were borrowed from the Las Vegas region and were estimated using an “aggregate” cross-classification analysis coupled with some guiding principles. The aggregate cross-classification technique was implemented by aggregating expanded trip attractions by the type of land use at the attraction end of the trip. Thus, if a person traveled from home to a store to shop and then traveled back home again, two HBShop attractions were shown at a retail land use.

Once total attractions by land use have been aggregated by land use, they are divided by the total employment (or households in the case of residential land uses) associated with the land use. Table 4-13 shows the land use types along with the associated type of employment or households used as the independent variable. While it is not possible to estimate any calibration statistics using this procedure, it has proved very successful in producing reasonable trip attraction models in other regions. It is not affected by the high correlation between the explanatory variables (e.g., employment by type) that typically plagues trip attraction models estimated using district-based linear regression techniques.

Table 4-13: Land Use Types and Explanatory Variables for Trip Attraction Rates

LAND USE TYPE	EXPLANATORY VARIABLE
Residential	Households
Basic industries including forestry, fishing, mining, manufacturing, public utilities, warehousing	Industrial employment
Retail	Retail employment
Recreational and personal services including theaters, schools, government, convention centers, daycare, sports facilities and gyms Churches and other religious facilities Medical facilities Banks Personal and business services including financial, insurance, and real estate, consultants, attorneys, accountants	Office and other non-classified employment
Casinos and hotels	Casino and hotel employment
Unknown Parks and open spaces	None

One guiding principle used in the estimation of trip attraction rates was that the explanatory variables had to be logical attractors of trips for the purpose being modeled. Thus, all home-based school trip attractions were assumed to occur at schools with the explanatory variable being school enrollment. Likewise, all home-based shop trip attractions were assumed to be made to retail establishments with retail employment being the explanatory variable.

Table 4-14 summarizes the trip attraction models. All rates shown in Table 4-14 are for person trips made in motorized vehicles. The following sections provide brief discussions of the trip attraction models.

Table 4-14: Trip Attraction Models

TRIP PURPOSE	TRIP ATTRACTION RATE PER HOUSEHOLD	REGULAR TRIP ATTRACTION RATE PER								TOTAL EMPLOYMENT-NON-HOTEL	
		EMPLOYMENT					SCHOOL ENROLLMENT				
		INDUSTRIAL	OFFICE AND NON-CLASSIFIED	RETAIL	CASINO-HOTEL	TOTAL	GRADES 1-8	GRADES 9-12	GRADES 13+		
HBWork	0.02				0.40	0.99					0.99
HBSchool							0.99	1.88	0.46		
HBSShop				2.37							
HBOther	0.38	0.60	2.46	2.07	0.48						1.97
Non-HB	0.20	1.08	1.08	3.36	0.24						0.51

Home-Based Work Trip Attraction Model

There are two items of note in the HBWork trip attraction model. First, there is a low HBWork trip attraction rate per household. While it might have been possible to specify that HBWork trips would be attracted only to establishments with employment, the low attraction rate per household is similar to that found in a number of other cities. The rate probably accounts for domestic help and service calls (e.g., insurance agents, plumbers, and large appliance repair personnel) made directly from the employee’s home to a residential worksite.

The HBWork trip productions will be output by income group in an effort to improve trip distribution modeling, and when a mode choice model is added to the modeling process, mode choice. Since the HBWork trip attraction model has not been stratified by income group, the total HBWork attractions will be scaled to match total productions for each of the four income groups in question. Such a procedure results in a trip attraction model that “assumes” that the same proportions of trip attractions by income group hold constant across all TAZs in the region. While such an assumption produces a gross regional average, the procedure and results are still quite effective in improving trip distribution and mode choice.

Home-Based School Trip Attraction Model

The HBSchool trip attraction rates vary by age of the student making the trip. The rate for elementary school-aged students (grades 1–8) is substantially lower than the rate for high school students. These rates probably reflect a higher likelihood for elementary school students to attend neighborhood schools within walking distance of the home and a higher likelihood for high school students to live farther from their schools as well as high school students’ capabilities of driving themselves to school.

The low HBSchool trip attraction rate per enrollee in grades 13 and higher probably reflects the “part-time” nature of those trips. Specifically, many students in post-high school educational institutions either attend part-time or establish their schedules so that they do not attend classes every school day.

Douglas County/Carson City Regional Travel Demand Model

Home-Based Shop Trip Attraction Model

The HBSshop trip attraction model was based on the assumption that all shop trips are attracted by retail employees. Based on the summary of the household survey data, numerous shop trips were made to non-retail land uses. Undoubtedly, this happened in some cases—a trip for shopping purposes might have been made to a retail establishment at a casino (listing the casino as the destination), a person could have stopped at a beauty salon to purchase hair care products, or a could have stopped at someone’s home to pick up goods from an in-home business. In some cases (e.g., the shopping trips to the beauty salon or the home), shopping trips are truly made to land uses with no retail employees. However, these unadjusted HBSshop rates for non-retail were very small (0.01 trips per employee). Thus, the assumption that all HBSshop trips are attracted by retail employment is reasonable.

The HBSshop rate per full-time equivalent retail employee might seem low—2.37 HBSshop trip attractions per retail employee suggests that each retail employee serves only about 1.15 people per day. However, if HBSshop, HBOther, and NHB trips per retail employee are summed, the overall attraction rate per retail employee is 11.16 (NHB must be counted twice due to the method used to model NHB trips), or about 5.6 people per day.

Home-Based Other Trip Attraction Model

The HBOther trip attraction model includes rates for all types of employment and for households. The travel demand model attracts 0.38 HBOther person trips per household. In essence, this suggests that, on the average, about one out of every five homes has a visitor during the day. Thus, the travel demand model focuses HBOther attractions more toward employment areas than toward residential areas.

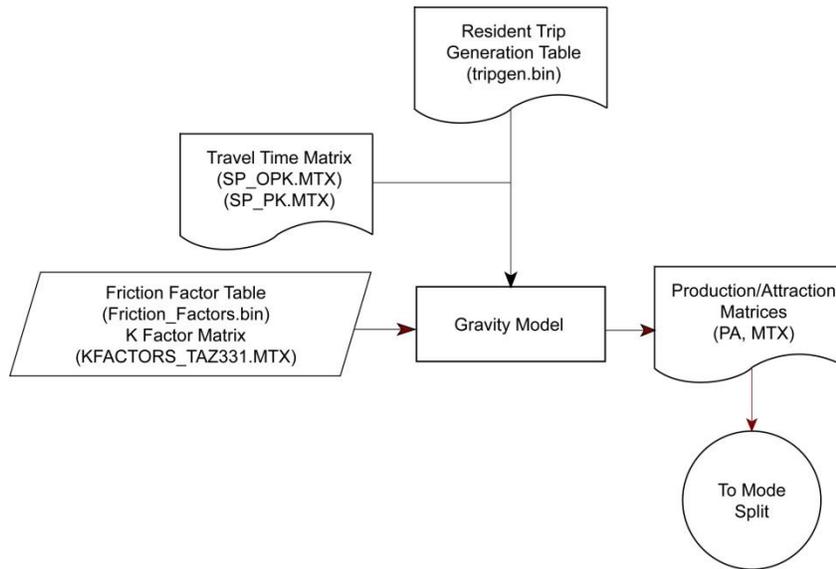

Non-Home-Based Trip Attraction Model

Like the HBOther trip attraction model, the NHB trip attraction model includes rates for all types of employment and for households. Continuing the example of trips attracted per household, the travel demand model attracts 0.2 NHB trips per day. Since NHB productions are set equal to NHB attractions on a TAZ-by-TAZ basis after balancing to the regional control total for NHB trips estimated using the household-based trip production model, each home attracts an average of 0.2 visitors per day. Combined with the HBOther rates, the travel demand model suggests that each home has 0.4 visitors per day, or in other words, every 2.5 homes has a visitor each day.

Special Generator Trip Attraction Models

The trip attraction model includes unique trip attraction rates for casinos and is considered as “special generator” with the ability to have unique trip attraction rates per employee. The special generator models simply affect the total trip attractions to these locations. It must be noted however that the special generators are not currently being used but are provided as part of the model development and can be used without any changes to the model structure.

5. TRIP DISTRIBUTION

Introduction

Trip distribution assigns the trips calculated during trip generation to the appropriate production and attraction TAZ pairs. The trips to each TAZ pair are determined based on the gravity model.

$$T_{ij} = P_i \times \left[\frac{K_{ij} \times F_{ij} \times A_j}{\sum_{k=1}^n (K_{ik} \times F_{ik} \times A_k)} \right]$$

where:

- T_{ij} = trips between zone i and zone j
- P_i = productions in zone i
- A_j = attractions in zone j
- K_{ij} = K-factor adjustment between zone i and zone j
- F_{ij} = friction factor between zone i and zone j
- i = production zone
- j = attraction zone
- n = total number of zones

The calibration process calculates the friction factors and K-factors used in the above equation. The goal in calibrating trip distribution is to arrive at friction factors and K-factors such that the average trip lengths and trip length frequency distributions resulting for each trip purpose are similar to those from survey data.

Gamma Function

The friction factors used in the Douglas County/Carson City Travel Demand Model are based on a gamma function. This type of function has three parameters—alpha (a), beta (b), and gamma (c)—as shown in the following equation.

$$F_{ij} = a \times t_{ij}^b \times e^{ct_{ij}}$$

where:

F_{ij} = friction factor between zone i and zone j

t_{ij} = travel time between zone i and zone j

a = alpha parameter

b = beta parameter

c = gamma parameter

This document adheres to the above equation in defining the three parameters. TransCAD, however, requires the values of beta and gamma to be of the opposite sign when defining the parameters. The values input into the TransCAD model script for beta and gamma are opposite the values listed in this document.

The gamma function is a smooth, monotonically decreasing function when both the beta and gamma parameters are negative. This suggests that travelers are sensitive to travel time as they travel to satisfy their needs. For example, a person is less likely to travel to a grocery store ten minutes from home if there is a store only five minutes from home.

If the calibrated beta parameter is positive, the function increases to an inflection point and then decreases as the travel time increases. In general, this should be avoided, since it implies that up to a certain point, travelers have a desire to travel further to satisfy their need for travel. In certain cases, a positive beta parameter can be justified.

If the calibrated gamma parameter is positive, the function decreases to a point and then increases. A positive gamma parameter can be used if the inflection point is greater than the highest travel time expected between any two points in the region. Alternatively, the function can be converted to a look-up table and modified to be equal to the minimum value at travel times greater than the inflection point.

Source of Data

The work trip length frequency distribution from the 2000 Census was obtained for Douglas County and Carson City. This observed data was used to compare the modeled trip length frequencies.

Calibration Process

The trip distribution calibration process included determining the parameters for the friction factors and calculating the K-factors. K-factors are calculated to adjust for major distribution characteristics not explained by travel time. These differences may be caused by natural or manmade barriers, such as rivers or railroads, or by socioeconomic characteristics. The first

Douglas County/Carson City Regional Travel Demand Model

process was to determine the friction factor parameters. After the friction factors were finalized, it was found that there was no need to calculate K-factors. The K-factors procedures are provided as part of the model development process but were not used

Friction Factor Parameters

The following list explains the general process taken for each trip purpose to calculate the friction factors.

- Run the model with reasonable set of friction factor parameters obtained from another region.
- Compare histograms and average trip lengths of the results of the model run with the observed data.
- Based on the results of the comparisons, calculate the desired friction factors for a new model run that would more closely match the observed trip length frequency distribution.
- Use linear regression techniques (based on a log-transformation of the gamma function) to convert the desired friction factors into revised gamma function parameters for use in TransCAD.
- Run the model with the new gamma function parameters and continue with the comparisons and calculations of new gamma parameters until the results compare reasonably with the observed data.

Calibrated gamma function parameters for home-based work trips are shown in Table 5-1 and Figure 5-1 shows the gamma functions.

Table 5-1: Final Friction Factor Parameters—Home-Based Work

PARAMETER	HBW-INCOME 1	HBW-INCOME 2	HBW-INCOME 3	HBW-INCOME 4

Gamma	-0.063	-0.063	-0.063	-0.063
Format	Function	Function	Function	Function

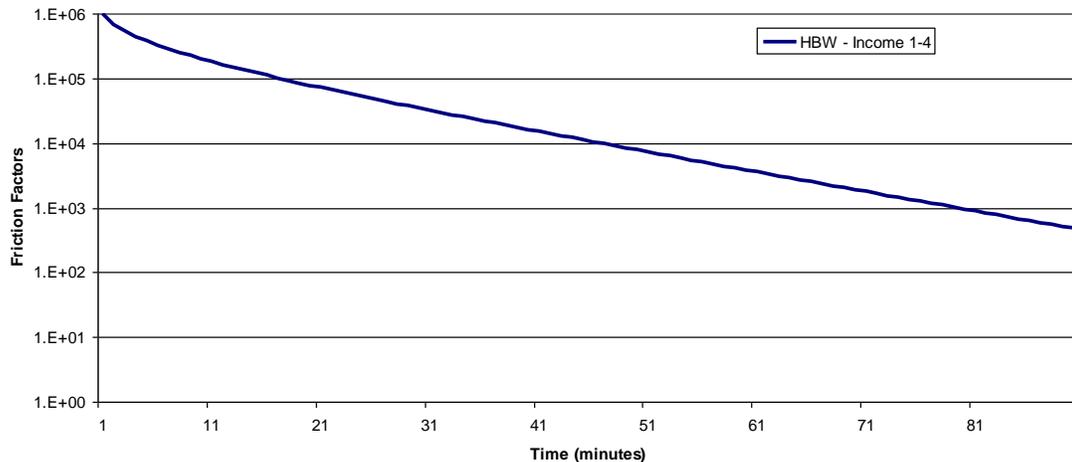

Figure 5-1: Friction Factor Parameters—Home-Based Work

Douglas County/Carson City Regional Travel Demand Model

Table 5-2 and Figure 5-2 show the friction factors for other resident trip purposes. The gamma parameter is positive for the home-based shop and home-based other trip purposes. The home-based shop gamma function begins increasing after about 80 minutes of travel time and the home-based other function begins increasing after about 60 minutes of travel time. For the non-home-based and home-based other trip purposes, the gamma function was converted to a tabular form for use in TransCAD. The friction factors for travel times greater than the times at the inflection points were modified to be equal to the minimum value of the gamma function.

Travel Time Comparison

The travel times information for HBW Journey to Work data was not available for 2010. More comprehensive information was available for the 2000 Census that was recently updated. The HBW trip travel times were compared to this data. The trip travel times in the model are slightly lower, as this does not reflect travel from Douglas County and Carson County to the external counties. The external networks are restricted to the gateway locations, and hence, the true length is not accurately represented for external travel.

It can also be seen that 90 percent of the work trips are within 44 minutes of commute time and the modeled trips reflect about 98 percent of the trips within the same time period. The travel time comparison of Home based work trips with the recently updated 2000 Census information is shown in Figure 5-3.

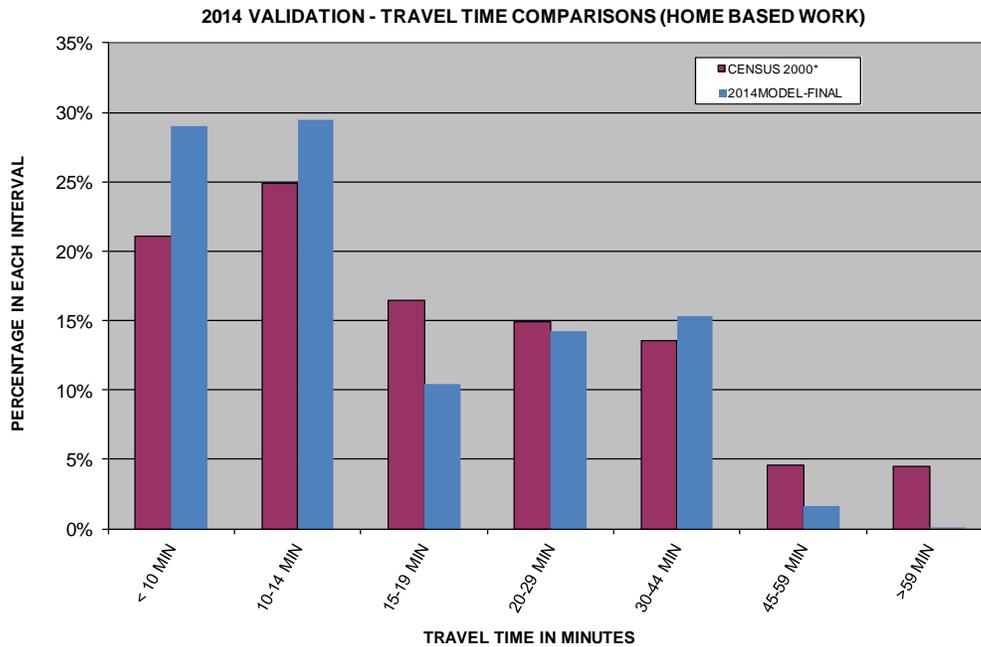

Figure 5-3. Home-based Work Travel Time Comparison

Travel Time and Trip Length Frequency Distributions

The travel time for Home based work trips is shown in Figure 5-4. The trip length frequency distributions are based on trip duration (time) using 5 minute “bins” to categorize the data. Table 5-3 summarizes the travel time results for all the Home-based work trip purposes.

The trip length (distance) for Home Based work trip purposes is shown in Figure 5-5 and uses 0.25 mile bins to categorize the data.

In other words, the bin for 5 minutes represents all trips in the range 5.0 to 9.99 minutes; the bin for 0.25 mile includes all trips in the range 0.0 to 0.25 miles.

Although no information was available for other trip purposes from the census, the travel times and trip distances for these other trip purposes are within acceptable limits. Figures 5-6 to 5-9 and the Table 5-4 summarizes the results for the non work trip purposes.

Trip Length Distribution Macro

A macro to automatically compute trip length distributions, calculate average trip distances and times, and calculate intrazonal trips by trip purpose was added. In the model interface, there is an output file parameter called “TLD Table” located in the output files of the Trip Distribution step. It reports out the average length, average time, total trips, intrazonal trips, and the percentage of intrazonal trips for all resident and visitor trip purposes. A sample file is shown below:

PURPOSE	AVGDIST	AVGTIME	TOTALTRIPS	INTRATRIPS	PERCENTINT
HBW_INC1_pk	7.15	14.59	5,020.3	81.6	0.016
HBW_INC2_pk	6.92	14.41	5,663.1	107.1	0.019
HBW_INC3_pk	6.73	14.47	15,269.3	343.4	0.022

Table 5-5 describes each field in the output trip length distribution table.

Table 5-5: Trip Length Distribution Table (tldtable.bin)

FIELD	DESCRIPTION
PURPOSE	Trip purpose, including total home-work and work-other trips aggregated by market segment
AVGDIST	Average trip distance in hundredths of miles
AVGTIME	Average trip time in hundredths of minutes
TOTALTRIPS	Total trips for trip purpose
INTRATRIPS	Intrazonal trips for trip purpose
PERCENTINT	Percentage of total trips that are intrazonal trips

6. MODE SPLIT

Introduction

In the travel models for the Douglas County and Carson City model, district-to-district mode split factors are applied to trip tables resulting from the trip distribution step to estimate person trips by transit and person trips by auto. Transit shares are applied to the total person trips to separate out the transit trips and the auto trips. Auto occupancy factors are then applied to convert person trips made in automobiles to vehicle trips for traffic assignment. For the travel models, aggregate auto occupancy models that account for differing characteristics of production zones were developed.

The auto occupancy models do not account for trip interchange characteristics such as travel time savings on HOV lanes or trip attraction zone characteristics (parking cost or special carpool parking preferences). Such characteristics might be taken into account when a mode choice model is developed or adopted for the region.

The transit share matrix for the Travel demand model was set to zero. This meant that all person trips coming out of the trip distribution was auto related. However, during the model development, a transit share matrix was added to so that in future transit share of the total person trips could be accounted for. Currently the model does not have any transit share associated with it.

Home-Based Auto Occupancy Models

A basic assumption underlying the estimation of the home-based average auto occupancy models is that the average auto occupancies are largely a function of socioeconomic characteristics in the production zone. The resulting models do not account for changes in average auto occupancy due to network characteristics (such as travel time or travel cost); however, they do account for variations in average household size, and when meaningful, different income levels. The models do not account for variation in auto occupancies at the attraction end of the trip, except as indirectly affected by the variation in average auto occupancies of trips attracted to the zone.

The home-based average auto occupancy models are an improvement over the typical state of the practice of using average regional auto occupancies by trip purpose for home-based trips. Experience in other areas has shown that auto occupancies vary throughout the region. The implementation of the home-based average auto occupancy models will cause variation in auto occupancies by production zone throughout the region.

The calibration of the home-based auto occupancy models was performed in a manner analogous to the calibration of trip production models. Specifically, cross-classification models were calibrated by summarizing and comparing average auto occupancies by trip purpose stratified by the income level and household size of the trip maker. Trip purposes and average auto occupancies were based on information reported by the auto driver for all purposes except home-based school. Adjacent cells in the cross-classification tables were combined to remove non-significant variation.

Tables 6-1 through 6-4 summarize the home-based average auto occupancies by trip purpose. The rates shown in Tables 6-1 through 6-4 are included in the TransCAD trip generation program implementation procedures since the zonal distributions of trip productions for households stratified by income group and household size are available within the trip generation routines. The TransCAD trip generation routine calculates and reports average home-based auto occupancies by trip purpose for each production zone.

Home-Based Work Average Auto Occupancies

No significant variation in the home-based work average auto occupancies was observed in the data when stratified by income group and household size of the trip maker. As a result, the home-based work average auto occupancy model defaults to the estimated regional average auto occupancy for home-based work trips. The lack of variation by income group and household size is reasonable considering that home-based work trips are less discretionary in nature than the other trip purposes.

Table 6-1: Home-Based Work Average Auto Occupancy Model

INCOME GROUP	HOUSEHOLD SIZE				
	1	2	3	4	5+
Low (less than \$19,999)	1.06	1.06	1.06	1.06	1.06
Lower-middle (\$20,000–\$29,999)	1.06	1.06	1.06	1.06	1.06
Upper-middle (\$30,000–\$49,499)	1.06	1.06	1.06	1.06	1.06
High (\$50,000 or more)	1.06	1.06	1.06	1.06	1.06

Home-Based School Average Auto Occupancies

Table 6-2: Home-Based School Average Auto Occupancy Model

INCOME GROUP	HOUSEHOLD SIZE				
	1	2	3	4	5+
Low (less than \$19,999)	1.00	1.00	1.28	1.28	1.28
Lower-middle (\$20,000–\$29,999)	1.00	1.00	1.28	1.28	1.28
Upper-middle (\$30,000–\$49,499)	1.00	1.00	1.00	1.28	1.28
High (\$50,000 or more)	1.00	1.00	1.00	1.28	1.28

Home-Based Shop Average Auto Occupancies

As can be seen in Table 6-3, home-based shop average auto occupancies vary by both income group and household size. As might be expected, average occupancies increase with increasing household size, since it is more likely for an extra household member to “ride along” on the shopping trip or be required for the shopping (for example, clothes shopping). There is also a tendency for average auto occupancies to decrease as income increases. This is probably due to increasing independence of household members as incomes increase. For many households, higher incomes are obtained as the employed household members become older, and probably have older children leading more independent lives. In addition, higher income households are more likely to own multiple vehicles.

Table 6-3: Home-Based Shop Average Auto Occupancy Model

INCOME GROUP	HOUSEHOLD SIZE				
	1	2	3	4	5+
Low (less than \$19,999)	1.07	1.35	2.20	2.20	2.20
Lower-middle (\$20,000–\$29,999)	1.07	1.35	1.39	1.91	1.91
Upper-middle (\$30,000–\$49,499)	1.07	1.35	1.39	1.91	1.91
High (\$50,000 or more)	1.07	1.35	1.39	1.56	1.56

Home-Based Other Average Auto Occupancies

As with the home-based shop average auto occupancies, home-based other average occupancies vary by income group and household size. The variation is similar to that noted for the home-based shop trip purpose: average auto occupancies tend to increase with increasing household size and decrease with increasing income. The reasons for the variation are probably the same as for home-based shop trips.

Table 6-4: Home-Based Other Average Auto Occupancy Model

INCOME GROUP	HOUSEHOLD SIZE				
	1	2	3	4	5+
Low (less than \$19,999)	1.26	1.62	1.92	1.93	3.25
Lower-middle (\$20,000–\$29,999)	1.11	1.62	1.92	1.93	2.20
Upper-middle (\$30,000–\$49,499)	1.11	1.48	1.58	1.93	2.20
High (\$50,000 or more)	1.11	1.34	1.58	1.93	2.20

Non-Home-Based Auto Occupancy Models

The Non-Home Based Auto Occupancy models developed for the Las Vegas region were used. A brief discussion of the calibration procedures used for the non-home-based average auto occupancy model is described below.

Since the actual location of the trip ends did not necessarily occur in the home zone locations of the trip makers, the use of demographic data to estimate average auto occupancies was illogical. Rather, non-home-based trips were related to the number of people (potential travelers) and the number of vehicles available in the zones where the non-home-based trips actually originated. This assertion was straightforward—the more potential travelers there were per vehicle, the higher the average auto occupancy for non-home-based trips.

District-based regression techniques were used to estimate the non-home-based auto occupancy model. Home-based person trips and home-based vehicle trips from the home-interview survey data were aggregated to 18 districts defined for the Las Vegas Valley area. Likewise, non-home-based person trips in autos and non-home-based auto trips were summarized to the production district of the actual trip. Note that person trips in autos were based on the auto occupancies reported by the auto drivers. Based on these data, the non-home-based average auto occupancies and the average “persons per auto arriving” were calculated for each district. The best regression models in terms of explanatory power (R^2) and significance of model coefficients were:

$$\text{NHBAO} = 0.36 + 0.83 * \text{PPAARR} \qquad R^2 = .60$$

where:

NHBAO = the non-home-based average auto occupancy

PPAARR = the persons per auto arriving for home-based non-work trip purposes

The R^2 value for the model suggests that it explains about 60 percent of the variance in non-home-based auto occupancies on a district basis. It should be noted that the model coefficients are similar to those estimated for several other cities using this type of aggregate non-home-based auto occupancy model.

If the PPAARR takes on the minimum value of 1.0, the resulting non-home-based average auto occupancies will be 1.19. At the regional average for PPAARR (1.41), the resulting modeled non-home-based average auto occupancy is 1.54. Note that this is slightly higher than the observed regional estimate for the non-home-based average auto occupancy, 1.49. This difference occurs because one of the observations used for the estimation of the model was excluded from the model estimation as an outlier (see Figure 6-1). While the model coefficients could have been

Douglas County/Carson City Regional Travel Demand Model

scaled to more closely match the regional non-home-based average auto occupancy when the regional average PPAARR was input, the changes were very small and well within the level of accuracy of the model.

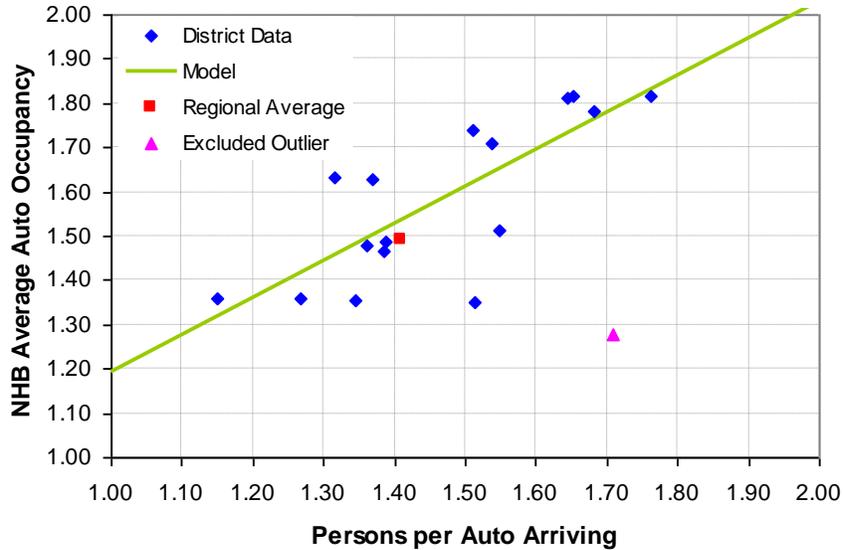

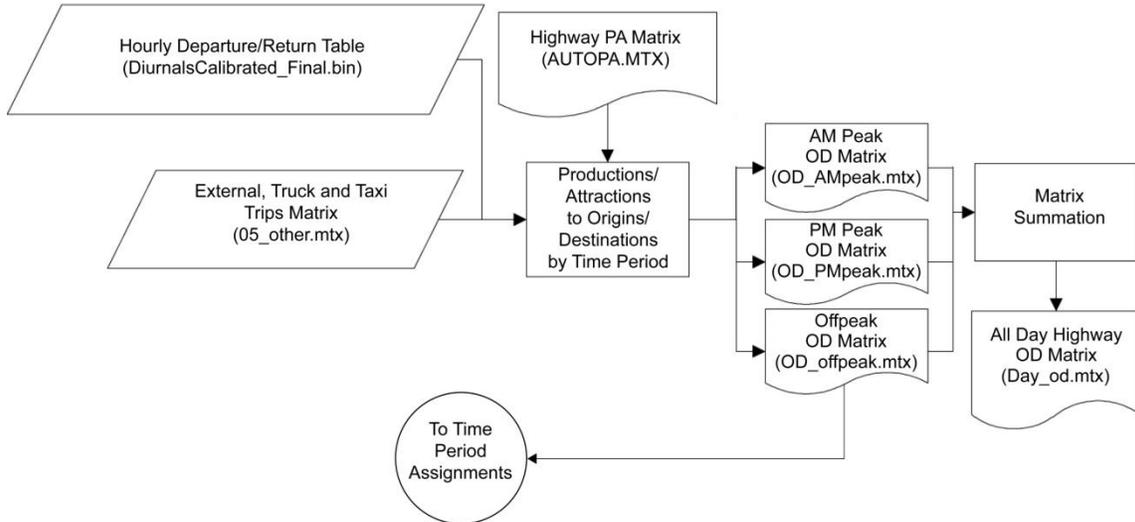

Figure 6-1: Non-Home-Based Average Auto Occupancy Calibration Data and Model

Since the district-based regressions were based on rates rather than total trips or some other extensive measure, there is no difficulty with applying the model at different geographic levels. When district based regression is used to estimate trip generation models, the constant must be factored out of the resulting model or the model must be run at the district level to give reasonable results. The above models can be applied at the zone level with no adjustment.

The number of persons per vehicle arriving at each zone can be determined from the results of the person trip distributions of home-based trips combined with the trip tables resulting from the applications of the home-based mode split and home-based auto occupancy models. In effect, the column sums of the home-based person trip matrices provide the persons arriving in each zone, and the column sums of the home-based vehicle trip matrices provide the number of vehicles arriving in each zone.

7. TRIP ASSIGNMENT

Production/Attraction to Origin/Destination and Time of Day Distribution

The Production/Attraction (PA) to Origin/Destination (OD) and time of day distribution process converts all auto PA person trip matrices into vehicle OD matrices by time period. For the Travel Demand Model, the 24 hour day was split into three time periods: 8 am to 9 am (AM Peak), 5 pm to 6 pm (PM Peak) and Offpeak (Rest).

Once the time periods were established, departure and return trip percentages were estimated for each time period. The percentages were estimated from a variety of sources and then the departure and return trip percentages were then adjusted to conform with the hourly counts. Table 7-1 lists the departure and return percentages for each trip purpose for each hour of the day.

Other Trips Matrix

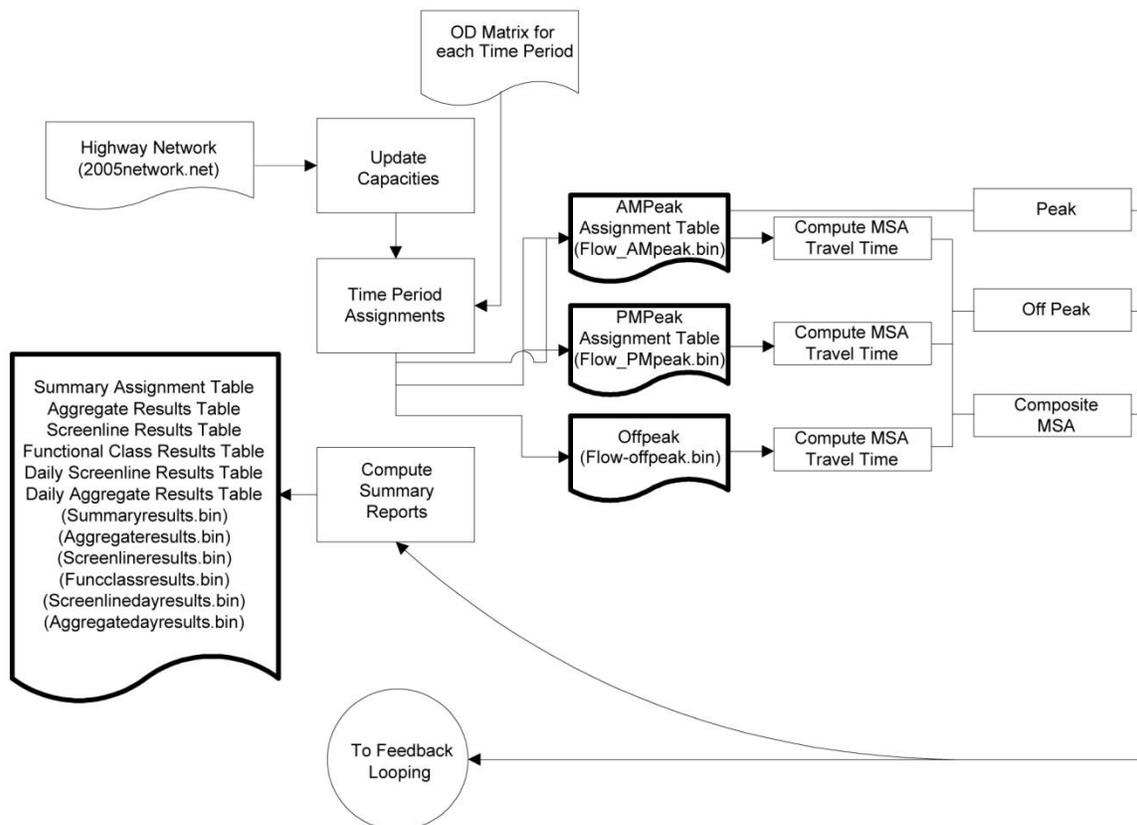

The input Other trips matrix consists of an estimated PA matrix of external-to-external and truck trips. The External to Internal and External to External for the base year was estimated based on the 2014 count information at the external stations. There are currently no truck trips in the model, but however a truck trip matrix was provided as part of the model development process. There are currently seven External/Gateway stations in the model.

Traffic Assignment

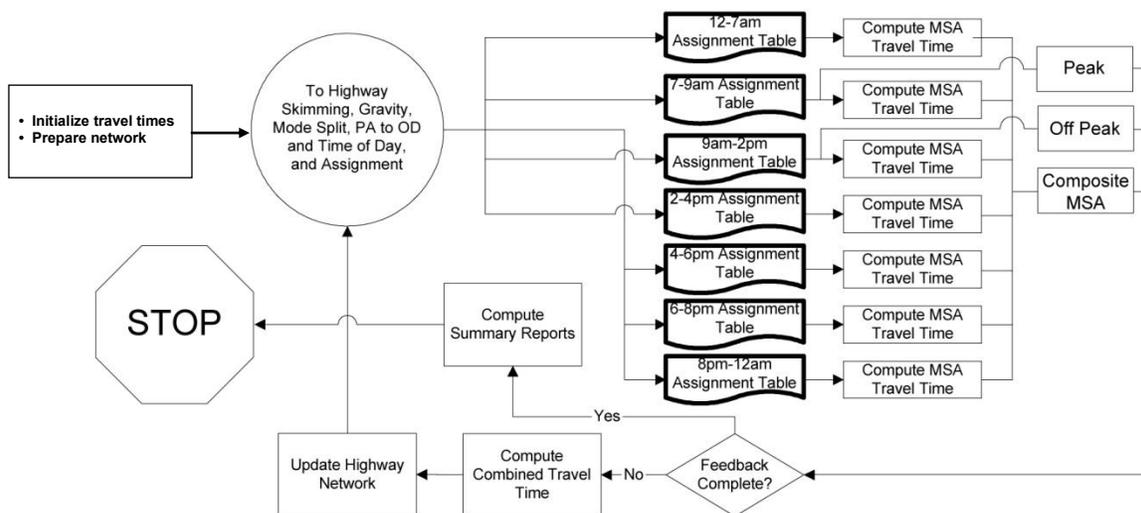

In this step, each of the time period OD matrices is assigned to the highway network. Different link capacities are computed for each time period assignment. The User Equilibrium method is utilized for each assignment with a default number of 40 iterations per assignment. After each assignment, a flow result table for each time period is generated. After all time period assignments are completed, several report tables are calculated:

- A summary assignment table that groups all time period assignments into one table, calculates a daily flow total, and compares all link counts to the flow totals for all time periods plus the daily total.
- An aggregate results table that compares link counts to flow totals grouped by functional class and time period.
- A screenline results table that compares links counts to flow totals grouped by screenline number and time period.
- A functional class results table that calculates total vehicle miles traveled (VMT) and average speeds by functional class.
- A screenline results table comparing link counts to flow totals. Unlike the previous screenline table, the counts used for this comparison come from the NDOT AADT counts instead of the hourly counts, thus only a daily comparison is available for this table.
- An aggregate results table that compares link counts to flow totals. Unlike the previous aggregate table, the counts used for this comparison come from the NDOT AADT counts instead of the hourly counts, thus only a daily comparison is available for this table.

Cold Start Flows and VMT

Cold start vehicle flows and VMT are also reported from the highway assignment. Used for air quality analysis, cold start flow represents the aggregate flow associated with only the first 505 seconds or other user-defined time period of travel in the network.

Feedback Looping

The feedback loop step uses the assignment model to calculate updated congested travel times. These congested travel times are then “fed back” into the network and the highway skim travel time matrix is re-calculated. Since this would change the results of the gravity model and any subsequent model that is in the stream process, all models are re-run with this updated information.

The purpose of a feedback loop is to generate realistic congested travel times so that the gravity model allocates trips to zones with more accuracy than by using free-flow travel times. The feedback loop is repeated several times until either the output flow volumes between successive loop iterations are within a convergence criteria or the number of iterations exceeds a specified amount. For resident trips, peak skims are used for home-based work trips while off peak skims are used for all other trip purposes.

The method of Multiple Successive Averages (MSA) is used to calculate the updated travel times used to feed back into highway skim. In this method, the calculated congested travel time by link is the combined average of loaded travel times calculated from previous feedback user-equilibrium iterations. The methodology is similar to the base method used for calculating volumes between iterations of user-equilibrium. This method of computing congested travel times has been shown in field tests to converge faster than the simpler method of feeding in directly the congested travel times resulting from the current user-equilibrium assignment.

Assignment Reports

Table 7-2 lists all the fields in the AMPEAK hour, PMPEAK hour and the OFFPEAK time period.

Douglas County/Carson City Regional Travel Demand Model

Table 7-2: Time Period Flow Table (FLOW_AMPEAK.BIN, FLOW_PMPEAK.BIN.BIN and FLOW_OFFPEAK.BIN)

FIELD	DESCRIPTION
ID1	Link ID
AB_Flow	Volume Flow in AB direction
BA_Flow	Volume Flow in BA direction
TOT_Flow	Total Volume Flow in both directions
AB_Time	Congested travel time in AB direction
BA_Time	Congested travel time in BA direction
MAX_Time	Congested travel time in both directions
AB_voc	Volume/Capacity ratio in AB direction
BA_voc	Volume/Capacity ratio in BA direction
MAX_voc	Volume/Capacity ratio in both directions
AB_vmt	Vehicle miles of travel in AB direction
BA_vmt	Vehicle miles of travel in BA direction
TOT_vmt	Vehicle miles of travel in both directions
AB_vht	Vehicle hours of travel in AB direction
BA_vht	Vehicle hours of travel in BA direction
TOT_vht	Vehicle hours of travel in both directions
AB_speed	Congested Speed in AB direction
BA_speed	Congested Speed in BA direction
AB_Cold_Flow	Volume Flow in the first 505 seconds of travel in AB direction
BA_Cold_Flow	Volume Flow in the first 505 seconds of travel in BA direction
TOT_Cold_Flow	Total Cold Flow in both directions
AB_Cold_V_Dist_T	Cold Flow VMT in AB direction
BA_Cold_V_Dist_T	Cold Flow VMT in BA direction

Table 7-3 describes all the fields in the summary reports file.

A functional classification report (see Table 7-4) outputs the daily Vehicle Miles traveled, the Total Daily flow and the Average speeds. The data is summarized by the different facility types that are present in the model.

Table 7-3: Results Table (Summaryresults.bin)

FIELD	DESCRIPTION
ID1	Link IDs
AB_TIME_XXXXXX / BA_TIME_XXXXXX	Congested Link travel times by direction and time period
Total_TIME_XXXXX	Total Congested travel time by time period
AB_FLOW_XXXXX / BA_FLOW_XXXXX	Assigned Link flows by direction and time period
Total_FLOW_XXXXX	Total Assigned Link Flows by time period
AB_DAY_FLOW / BA_DAY_FLOW	Total Daily Flow by direction
TOT_DAY_FLOW	Total Daily Flow
AB_VOC_DAY / BA_VOC_DAY	Daily Volume -to-Capacity ration by direction
DAY_VMT	Total Daily VMT
AVG_DAY_SPEED	Daily Average speed
AB_VOC_XXXXX / BA_VOC_XXXXX	Volume -to-Capacity ration by direction and time period

XXXXX = Time period

Table 7-4: Functional Class Results Table (FuncclassResults.bin)

FIELD	DESCRIPTION
FTYPE_NUM	Functional classification
DAY_VMT	Total daily vehicle miles of travel
TOT_DAY_FLOW	Total daily flow
[Avg AVG_DAY_SPEED]	Daily average speed

Traffic Assignment Validation

The model validation targets (tolerances) are based on several criteria which are as follows.

- Compare modeled traffic volumes to observed traffic counts across all facility types by percent volume deviation, with the maximum desirable deviation being around 10 percent.
- Use the Federal Highway Administration recommended error limits for total difference (model – count) by functional classification as a region-wide validation:
 - Freeways less than 7 percent error
 - Expressways less than 10 percent error
 - Arterials less than 15 percent error
 - Collectors less than 25 percent error
 - Frontage roads less than 25 percent error

Douglas County/Carson City Regional Travel Demand Model

- Use the percent error by volume range recommended by the NCHRP report 255, as follows:
 - < 5000 Volume Range: 60 percent deviation
 - > 4999 and <10000 Volume Range: 40 percent deviation
 - > 9999 and <15000 Volume Range: 32 percent deviation
 - >14999 and <20000 Volume Range: 29 percent deviation
 - >19999 and <25000 Volume Range: 27 percent deviation
 - >24999 and <30000 Volume Range: 25 percent deviation
- Screenlines should be within 10 percent of the observed counts.

The model validation statistics are as follows.

- A comparison of all counts across facility types is well within the acceptable tolerance of 10 percent. The daily is within 3 percent; the AM peak is within 3 percent; and the PM peak is within 8 percent.
- The daily comparison shows that the freeways are at 1 percent (within the acceptable range of 7 percent), arterials are at 7 percent (within the acceptable range of 15 percent), and collectors are at 13 percent (within the acceptable limits of 25 percent).
- The daily comparison shows that the volume ranges are within acceptable criteria, with the highest being 13 percent, which is well below the threshold of 27 percent.
- Most of the 29 screenlines for the daily comparisons are within 10 percent of the counts.

The 2014 validation screenline locations are illustrated on Figures 7-1 and 7-2. The validation results as compared to the counts are shown in Tables 7-5 through 7-7. The comparison is made for the AM Peak, PM Peak, OFFPEAK and Daily traffic volumes. The overall total percent deviation from the screenline is 5 percent for AM, 4 percent for PM, -8 percent for the OFFPEAK and -6 percent for the Daily. Individual screenlines may experience more variations for the different time periods.

The 2014 model results for the vehicle hours traveled (VHT) and vehicle miles traveled (VMT) are shown in the Tables 7-8 through 7-10. The VMT and VHT are stratified by facility type and area type and are shown for the different time periods such as; AM, PM, OFFPEAK and daily. They are also summarized by county for the same time periods.

8. TRAVEL FORECAST MODEL APPLICATION

The Douglas County/Carson City Travel Demand Model may be utilized to simulate existing conditions and to forecast future conditions. In addition to estimating peak hour and daily traffic volumes, the model may be used to assess traffic level of service conditions.

Table 8-1 shows the level of service (LOS) thresholds that were assumed for the traffic operational performance on the different facilities. The results for the 2014 model validation forecast are shown in Table 8-2 for the different facility types and LOS thresholds. Figure 8-1 illustrates the level of service on various facilities for the 2014 model validation and application, while Figure 8-2 illustrates the existing daily volumes of traffic on those facilities.

Table 8-1: Level of Service Thresholds Used for LOS Calculations

ROADWAY TYPE	TOTAL DAILY VEHICLES IN BOTH DIRECTIONS (ADT)				
	A	B	C	D	E

Douglas County/Carson City Regional Travel Demand Model

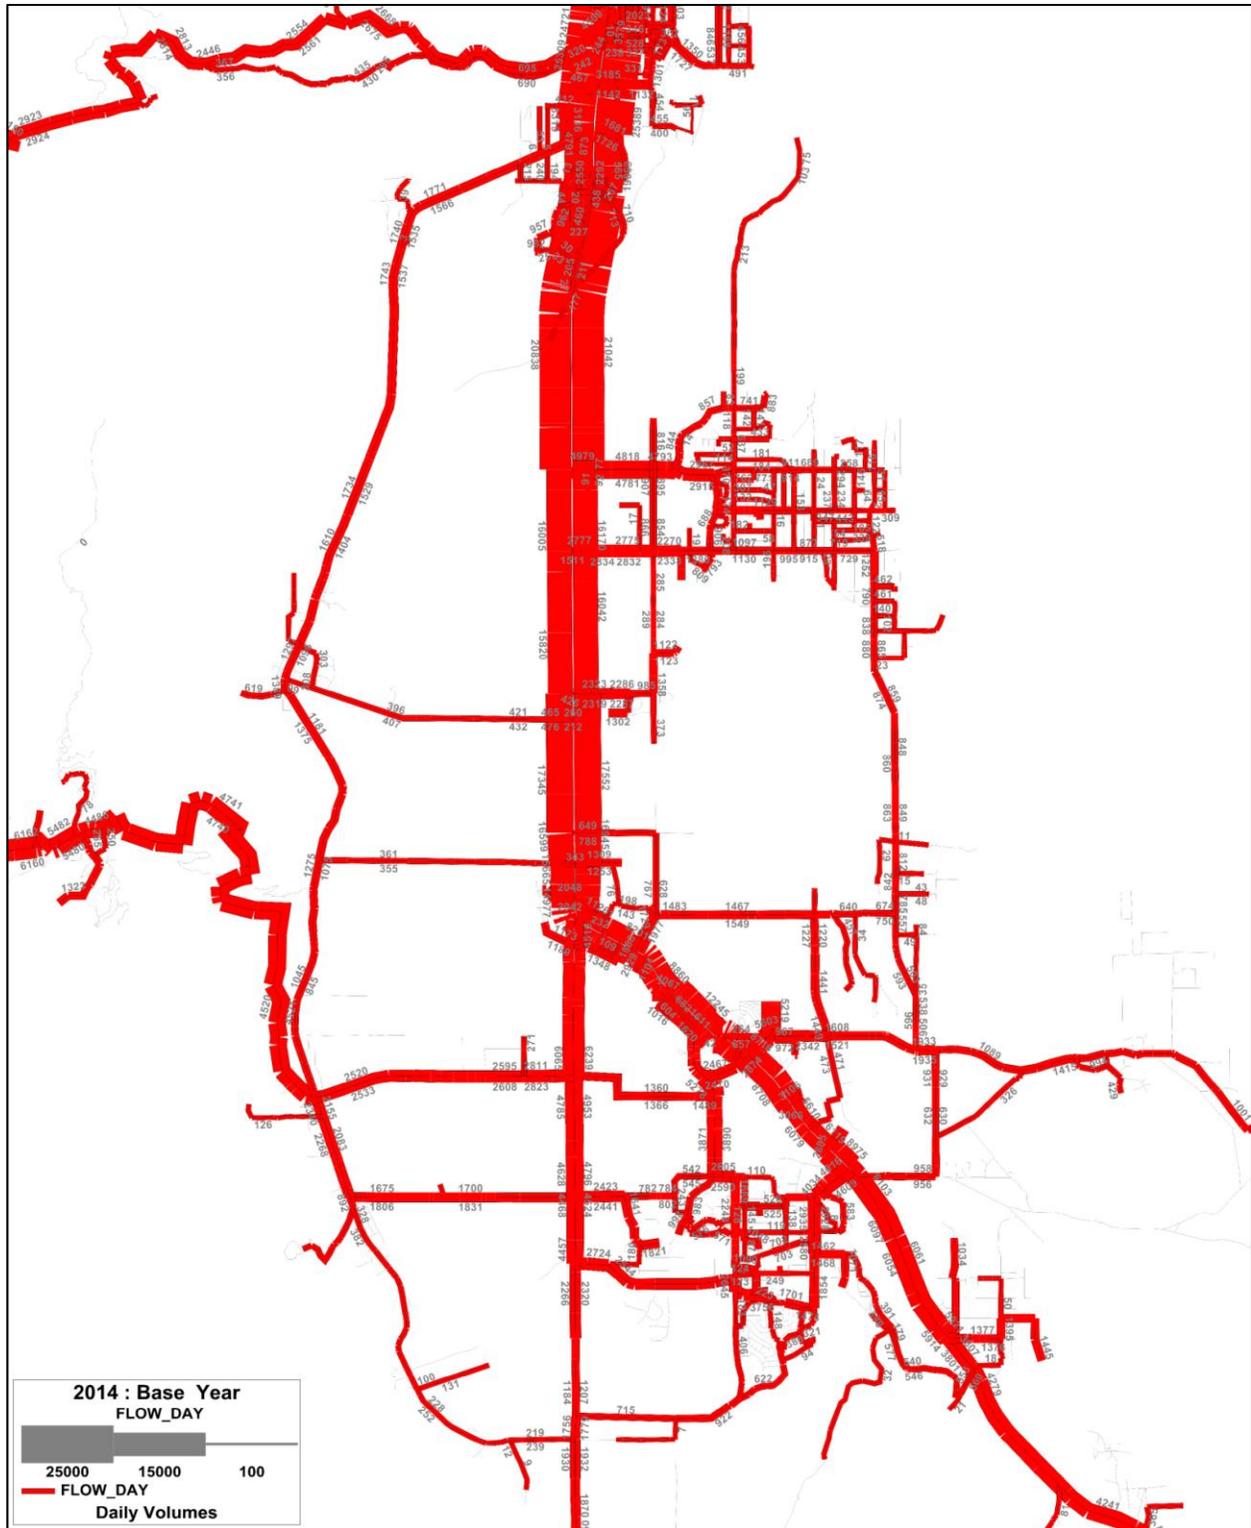

Figure 8-2: Year 2014 Existing Daily Traffic Volumes

9. FUTURE FORECASTS

Historic growth projection rates were used to produce future traffic forecasts for years 2025 and 2040. Table 9-1, below, presents land use data for year 2025, while Table 9-2 presents land use data for year 2040. Future condition levels of service and daily traffic volumes for two scenarios are illustrated on Figures 9-1 through 9-3 (year 2025) and Figures 9-4 through 9-6 (year 2040).

APPENDICES

Douglas County/Carson City Regional Travel Demand Model

Appendix A: Input Files, Output Files and Parameters

This appendix describes the input and output files and parameters of the travel demand model.

Field_Name	Type	Index	Description
ID	Integer (4 bytes)	*	unique Link Identification Number
Length	Real (8 bytes)	*	Length of the link in miles
Dir	Integer (2 bytes)	*	one-way or 2-way links (Dir 0 = 2-way link, Dir 1 = 1-way link)
NAME	Character	*	Street Name
FTYPE_NUM	Integer (4 bytes)	*	Integer form of the Functional Class of a link
FTYPE_NAME	Character	*	Type of Functional Class
ATYPE_NUM	Integer (4 bytes)	*	Integer form for Area Type
ATYPE_NAME	Character	*	Description of Area Type (i.e. suburban, rural, etc.)
AB_LANES	Real (8 bytes)	*	Number of Lanes on AB Direction of Link
BA_LANES	Real (8 bytes)	*	Number of Lanes on BA Direction of Link
UNIT	Integer (4 bytes)	*	Must have a Value of 1
DAY_LANE_CAP	Integer (4 bytes)		Daily Capacity per Lane
HOUR_LANE_CAP	Integer (4 bytes)		Hourly Lane Capacity
AB_SPEED	Real (8 bytes)		Free-flow Speed on AB Direction of Link (mi/hr)
BA_SPEED	Real (8 bytes)		Free-flow Speed on BA Direction of Link (mi/hr)
ALPHA	Real (8 bytes)		BPR Coefficient
BETA	Real (8 bytes)		BPR Exponent
ALT_BETA	Real (8 bytes)		Alternative BPR Coefficient for a link
ALT_CAP	Real (8 bytes)		Alternative Capacity for a link
ALT_SPEED	Real (8 bytes)		Alternative Speed for a link
AB_TIME	Real (8 bytes)		Free Flow Travel Time in AB Direction of Link (computed as Length/AB_SPEED * 60)
BA_TIME	Real (8 bytes)		Free Flow Travel Time in BA Direction of Link (computed as Length/BA_SPEED * 60)
AB_TIME_PK	Real (8 bytes)		For First Iteration =*Time, else time is AMPEAK
BA_TIME_PK	Real (8 bytes)		For First Iteration =*Time, else time is AMPEAK
AB_TIME_OPK	Real (8 bytes)		For First Iteration =*Time, else time is OFFPEAK
BA_TIME_OPK	Real (8 bytes)		For First Iteration =*Time, else time is OFFPEAK
AB_TIME_AVG	Real (8 bytes)		For First Iteration =*Time, else Weighted Average of (AMPEAK, PMPEAK & OFFPEAK)
BA_TIME_AVG	Real (8 bytes)		For First Iteration =*Time, else Weighted Average of (AMPEAK, PMPEAK & OFFPEAK)
AB_HR_CAP	Integer (4 bytes)		One Hour Link Capacity
BA_HR_CAP	Integer (4 bytes)		One Hour Link Capacity
AB_10HR_CAP	Integer (4 bytes)		Offpeak Capacity is equal to 10* Hour Link Capacity
BA_10HR_CAP	Integer (4 bytes)		Offpeak Capacity is equal to 10* Hour Link Capacity
AB_DAY_CAP	Integer (4 bytes)		Daily Link Capacity
BA_DAY_CAP	Integer (4 bytes)		Daily Link Capacity
AB_COUNT_AMPeak	Integer (4 bytes)	**	am peak hour Counts
BA_COUNT_AMPeak	Integer (4 bytes)	**	am peak hour Counts
AB_COUNT_PMPeak	Integer (4 bytes)	**	pm peak hour Counts
BA_COUNT_PMPeak	Integer (4 bytes)	**	pm peak hour Counts
AB_COUNT_OffPeak	Integer (4 bytes)	**	offpeak period Counts
BA_COUNT_OffPeak	Integer (4 bytes)	**	offpeak period Counts
AB_COUNT_Daily	Integer (4 bytes)	**	Daily Counts
BA_COUNT_Daily	Integer (4 bytes)	**	Daily Counts

Douglas County/Carson City Regional Travel Demand Model

Field Name	Type	Index	Description

AB_NDOT_3DAY_Daily	Real (8 bytes)		
BA_NDOT_3DAY_Daily	Real (8 bytes)		
TOT_NDOT_3DAY_Daily	Real (8 bytes)		
PD_DAILY	Integer (4 bytes)		
INCLUDECOUNT	Integer (4 bytes)	**	Used in Summary Calculations - 1 indicates link will be used for comparisons of count to Peak/offpeak hour traffic volumes
INCLUDEALLCOUNT	Integer (4 bytes)	**	Used in Summary Calculations - 1 indicates link will be used for comparisons of count to Daily traffic volumes
SCREENLINE	Integer (4 bytes)	**	Used in Summary Calculations - 1 indicates the link will be used for hourly count calculations
SCREENLINEALL	Integer (4 bytes)	**	Used in Summary Calculations - 1 indicates the link will be used for Daily count calculations
JURISDICTIONS	Integer (4 bytes)		Jurisdiction boundaries
KFACTOR_DISTRICTS	Integer (4 bytes)		kfactor districts based on links
CFCC	Character		
FID_COUNTY	Integer (4 bytes)		
COUNTY_NAME	Character		
STATE_NAME	Character		
STATE_FIPS	Character		
CNTY_FIPS	Character		
FIPS	Character		

Field names denoted with a “*” are required fields for the model. Field names denoted with a “**” are required only in the model option that compares count information with model flow results.

Speed-Capacity Lookup Table (speedcaptable_final.bin)

Field	Description
FTYPE_NUM	Functional Classification
ATYPE_NUM	Area Type Classification
R_Speed	Free Flow Speeds for cross classification
R_DAYCAP	Daily capacity per lane for cross classification
R_HOURCAP	Hourly capacity per lane for cross classification
R_ALPHAVALUE	BPR alpha value for cross classification
R_BETAVALUE	BPR Beta Value for cross classification

Turn Penalties Table (05_Turn_Prohib.bin)*

Field	Description
FROM_ID	From Link ID
TO_ID	To Link ID
PENALTY	Penalty Value, missing value denotes a prohibition

Douglas County/Carson City Regional Travel Demand Model

Demographics Table (2014_Landuse.bin)

Field	Description
TAZ	Zone Number
DISTRICT	District Number
POP	Population
DU	Dwelling Units
OCCDU	Occupied Dwelling Units
TOTEMP	Total Employment
HOTEL	Hotel Employment
OFFICE	Office Employment
INDUST	Industrial Employment
R_SHOP	Retail Shop Employment
C_SHOP	Commercial Shop Employment
OTHER_RET	Other Retail Employment
OTHER_NON	Non Retail Employment
RETAIL	Total Retail Employment
CASINO_SPGN	Casino Special Generator
F18	Elementary/Middle School Employment
F912	High School Enrollment
F13	Community College Employment
MED_INC	Median Income for the TAZ
JURIS_ID	Jurisdiction ID

Residential Trip Generation Table

Field	Description
ID	TAZ
HBWP_INC1	Home Based Work Income group 1 Productions
HBWA_INC1	Home Based Work Income group 1 Attractions
HBWP_INC2	Home Based Work Income group 2 Productions
HBWA_INC2	Home Based Work Income group 2 Attractions
HBWP_INC3	Home Based Work Income group 3 Productions
HBWA_INC3	Home Based Work Income group 3 Attractions
HBWP_INC4	Home Based Work Income group 4 Productions
HBWA_INC4	Home Based Work Income group 4 Attractions
HBSCHP	Home Based School Productions
HBSCHA	Home Based School Attractions
HBSHOPP	Home Based Shop Productions
HBSHOPA	Home Based Shop Attractions
HBOTHERP	Home Based Other Productions
HBOTHERA	Home Based Other Attractions
NONHBP	Non Home Based Productions
NONHBA	Non Home Based Attractions

Friction Factors Table (FrictionFactors.bin)

Field	Description	Function
TIME	Travel Time	
HBW	Home Based Work Friction Factors (By Income Group)	Gamma
HBSCH	Home Based School Friction Factors	Gamma
HBSHOP	Home Based Shop Friction Factors	Gamma
HBOTHER	Home Based Other Friction Factors	Table
NONHB	Non Home Based Friction Factors	Table

Douglas County/Carson City Regional Travel Demand Model

Time Period Flow Table (Flow_ampeak.MTX, Flow_pmpeak.MTX, etc.)

Field	Description
ID1	Link ID
AB_Flow	Volume Flow in AB direction
BA_Flow	Volume Flow in BA direction
TOT_Flow	Total Volume Flow in both directions
AB_Time	Congested travel time in AB direction
BA_Time	Congested travel time in BA direction
MAX_Time	Congested travel time in both directions
AB_voc	Volume/Capacity ratio in AB direction
BA_voc	Volume/Capacity ratio in BA direction
MAX_voc	Volume/Capacity ratio in both directions
AB_vmt	Vehicle miles of travel in AB direction
BA_vmt	Vehicle miles of travel in BA direction
TOT_vmt	Vehicle miles of travel in both directions
AB_vht	Vehicle hours of travel in AB direction
BA_vht	Vehicle hours of travel in BA direction
TOT_vht	Vehicle hours of travel in both directions
AB_speed	Congested Speed in AB direction
BA_speed	Congested Speed in BA direction
AB_Cold_Flow	Volume Flow in the first 505 seconds of travel in AB direction
BA_Cold_Flow	Volume Flow in the first 505 seconds of travel in BA direction
TOT_Cold_Flow	Total Cold Flow in both directions
AB_Cold_V_Dist_T	Cold Flow VMT in AB direction
BA_Cold_V_Dist_T	Cold Flow VMT in BA direction

Results Table (Summaryresults.bin)*Field is irrelevant or not created if count information is not present in the line geography and if the option to compare counts with flows is turned off.

Summary Results Table

Field	Description
ID1	Link IDs
AB_TIME_XXXXXX / BA_TIME_XXXXXX	Congested Link travel times by direction and time period
Total_TIME_XXXXX	Total Congested travel time by time period
AB_FLOW_XXXXX / BA_FLOW_XXXXX	Assigned Link flows by direction and time period
Total_FLOW_XXXXX	Total Assigned Link Flows by time period
AB_DAY_FLOW / BA _DAY_FLOW	Total Daily Flow by direction
TOT_DAY_FLOW	Total Daily Flow
AB_VOC_DAY / BA_VOC_DAY	Daily Volume -to-Capacity ration by direction
DAY_VMT	Total Daily VMT
AVG_DAY_SPEED	Daily Average speed
AB_VOC_XXXXX / BA_VOC_XXXXX	Volume -to-Capacity ration by direction and time period

XXXXX = Time period

*Table is only created if count information is present and if option to compare counts with flows is turned on.

Functional Class Results Table (FuncclassResults.bin)*

Field	Description
FTYPE_NUM	Functional classification
DAY_VMT	Total Daily Vehicle Miles of Travel
TOT_DAY_FLOW	Total Daily flow
[Avg AVG_DAY_SPEED]	Daily Average Speed

The following table describes each of the generic parameters assignment step in the model:

Parameter	Description
Assignment Type	1 = use User Equilibrium, 2 = use Stochastic User Equilibrium
Random Factor	If SUE is chosen from above, perturb link travels times by this percent, otherwise ignore
Calculate counts*	1 = If network has count information, calculate differences between flows and counts
Assignment iterations	Number of assignment iterations to use for each time period (must choose List radio button)

If you are running the model on a network that does not have count fields (i.e., a future year network), you must put in a “0” for this parameter. By default, the model runs the base year 2014 network which does have count fields and thus, the default for this parameter is “1.”

APPENDIX C

Douglas County Transportation Plan Draft Comments

2017 Douglas County Transportation Plan

Comments Received Regarding the Draft Transportation Plan and Final Disposition

1. **Comment:** Page 80, Airport Master Plan is not on County website. It is on Airport website www.mindentahoeairport.com. I would like to send you the jpg of our actual logo and an updated airport layout map. What about State plan for traffic light at airport road?

Author: Bobbi Thompson, Minden-Tahoe Airport Manager, in writing at public meeting on 10/20/16.

Response: Language on page 80 was revised to indicate that the Airport Master Plan is available on the Minden-Tahoe Airport website, and that the Douglas County website contains a link to the Minden-Tahoe Airport website. NDOT staff has indicated that they are currently pursuing right-of-way for improvements at the US 395/Airport Road intersection, and that they intend to advertise the project for construction in 2017.
2. **Comment:** NDOT is going to piddle around with all their "counts" instead of solving the truck problem with the bypass. The current bypass route is in the wrong location. Follow the pioneers and bridge where they did, go behind Hot Springs Mountain and go along the Pine Nut foothills to the other side of Ruhenstroth. It will require minimum impact to Douglas County.

Author: Jim Madsen, Douglas County Planning Commissioner, in writing at public meeting on 10/20/16.

Response: This comment appears to be similar to Commissioner Penzel's comment, listed as #5 below. This information was included in the packets for the Planning Commission and the Board of County Commissioners for their consideration on November 8 and December 1, 2016 respectively. No change was made to the draft Transportation Plan in response to this comment.
3. **Comment:** Not sure if one of you can answer this, but I was wondering why the pictures on page 9 and 10 of the plan are labeling it "Carson Valley" and showing Carson City and Lake Tahoe?

Author: Coleen Thran-Zepeda, Development Coordinator for Douglas County, via email on 10/20/16 to Mimi Moss.

Response: The titles of figures 2.1, 2.2 and 2.3 were revised to include Carson City and Lake Tahoe.
4. **Comment:** Page 83 of the Transportation Plan states: *On December 3, 2015, the Board of Commissioners approved Ordinance No. 2015-1446, increasing its county option motor vehicle fuel tax from \$0.04 to \$0.09 per gallon on gasoline and gasohol (NRS*

373.030). On that date, the Board also approved Ordinance 2015-1445, which imposed an additional \$0.25 sales tax with an effective date of April 1, 2016. It is expected to generate \$1,500,000 annually for infrastructure use, including a portion for road maintenance and road construction projects.

I think this statement is false: "On that date, the Board also approved Ordinance 2015-1445, which imposed an additional \$0.25 sales tax with an effective date of April 1, 2016".

Author: Steven Thaler, Douglas County Commissioner via email to Mimi Moss on 10/19/16.

Response: The statement is false. The language on page 83 was revised to indicate that Ordinance 2015-1445 failed on its second reading on December 3, 2015.

5. **Comment:** Barry Penzel submitted a map showing an alternate alignment for the Eastside Bypass entirely on BLM land in Douglas County, along with an explanation of the route.

Author: Barry Penzel, Douglas County Commissioner to Erik Nilssen.

Response: This information was included in the packets for the Planning Commission and the Board of County Commissioners for their consideration on November 8 and December 1, 2016 respectively. No change was made to the draft Transportation Plan in response to this comment. (See also comment #7.)

6. **Comment:** Eugene Russell suggested a change in the alignment of the Eastside Bypass that would move it away from his home on Fish Springs Road via email correspondence with Erik Nilssen, County Engineer.

Author: Eugene Russell, a Douglas County resident via email to Eric Nilssen.

Response: This information was included in the packets for the Planning Commission and the Board of County Commissioners for their consideration on November 8 and December 1, 2016 respectively. No change was made to the draft Transportation Plan in response to this comment.

7. **Comment:** Barry Penzel stated he wants to convince the RTC to change the alignment of the future Eastside Bypass. He suggested that the bypass connect to US 395 south of Gardnerville near the China Springs Road intersection with the highway. Connecting at this point would facilitate an alignment that could be entirely on federal land, without crossing any private or BIA lands. He stated that the road could be funded by constructing it as a toll road.

Author: Barry Penzel, Douglas County Commissioner verbally at the RTC meeting on 10/26/16.

Response: The alignment for the Eastside Bypass shown in the Draft Plan connects to US 395 at the point where the future East Ranchos Connection meets the highway. This alignment provides a direct route from the Ranchos to the Eastside Bypass. The alternate alignment, proposed by Mr. Penzel, is attached. If the alternate alignment is implemented, vehicles leaving the Ranchos via the East Ranchos Connection would need to drive south on US 395 to access the Bypass. Additionally, the alternate alignment is approximately 6 miles longer, increasing the estimated cost by \$96 million. No change was made to the draft Transportation Plan in response to this comment.

8. **Comment:** Keith Ruben, representing the Dean Seeman Foundation, requested that the future Ironwood Drive Extension east of the East Minden Village Loop removed from the Plan. He is not opposed to having a local road at this location that would connect to Buckeye Road. However he does not feel that the road should be classified as a collector, especially since it is not needed to maintain acceptable levels of service through the 2040 planning horizon.

Author: Keith Ruben of RO Anderson Engineering verbally and in writing at the RTC meeting on 10/26/16.

Response: The Ironwood Drive Extension has been an adopted element of the Master Plan since the 1996 Transportation Plan. It connects two major collectors; the existing Ironwood Drive segment to the west, and Heybourne Road to the east which will be constructed as part of the road improvements for The Ranch at Gardnerville. The Ironwood Drive Extension provides an alternate route parallel to U.S. 395 in downtown Minden that would assist with relief of traffic congestion in that area. The right-of-way width requirement for a collector is 80 feet, verses 60 feet for a local road. Designation of this road segment as a local road is not appropriate. No change was made to the draft Transportation Plan in response to this comment. (See also comment #13.)

9. **Comment:** Nancy McDermid wants a statement in the updated plan that the Westside Bypass is not feasible due to flood plain and view shed issues, and the potential for a conservation easement that would conflict with the future roadway alignment.

Author: Nancy McDermid, RTC Vice Chair, verbally at the RTC meeting on 10/26/16.

Response: The Westside Bypass is not needed to maintain acceptable levels of service through the planning horizon of 2040. However, it is identified as a needed project in the 2007 report "*U.S. 395 Southern Sierra Corridor Study*", a current NDOT document. Also, it identifies a new road alignment. Accordingly, it remains in the updated Plan in the category "*Projects Needed for Alternate Local and Regional Access*". If constructed it would pass through existing AO and AE floodplains. It would also pass through the North-South Carson Valley View Corridor and the East-West Carson Valley View Corridor

as defined in the Douglas County Open Space and Agricultural Lands Preservation Implementation Plan, 2007. The elevation of the roadbed, if constructed, would not likely have a significant impact on views. No change was made to the draft Transportation Plan in response to this comment.

10. **Comment:** Gregg Lynn questioned the statement that all of the vested allocations would be built out by 2025 under the 1.39% Historic Growth Rate for population.

Author: Greg Lynn, RTC Chair, verbally at the RTC meeting on 10/26/16.

Response: Beginning with an estimated 2015 population of 49,800 and using a growth rate of 1.39% compounded annually for 10 years yields an estimated 2025 population of 57,200. This is a net increase in population of 7,400 persons. At 2.39 persons per household on average, this population increase equates to 3,100 new households. The total number of vested allocations from table 2.5 is 3,114. This indicates that, at a growth rate of 1.39% annually, nearly all of the anticipated growth between 2015 and 2025 could be accommodated by the tentatively approved subdivisions in the Minden/Gardnerville and Topaz Lake areas. However, development would not be restricted to these vested subdivisions. No change was made to the draft Transportation Plan in response to this comment.

11. **Comment:** Jo Etta Brown asked whether the updated Transportation Plan contains recommendations for future transit services. She also asked about the status of the transit services provided by the Tahoe Transportation District.

Author: Jo Etta Brown, Planning Commissioner, verbally at the 11/8/16 meeting of the Planning Commission.

Response: Chapter 5, the Public Transportation Element of the updated Transportation Plan recommends that the County prepare a short-range transit plan within the next three years to determine the logistics of implementing improved local transit services. Issues to be considered include expanding service hours and service areas, connecting rural communities, increasing frequency of demand-responsive services, developing transit system goals and objectives, developing a comprehensive transit financial plan, and preserving a transit corridor along the former V&T Railroad right-of-way. Regarding changes to the transit services provided by the Tahoe Transportation District (TTD), effective October 2, 2016 transit route 19x was suspended and routes 19x, 20x and 23 were modified. It is the nature of transit systems to be always changing. Section 5.1.3 BlueGo Transit Service contains a link to the BlueGo website where the current transit schedule can be found. No change was made to the draft Transportation Plan in response to this comment.

12. **Comment:** A question was raised about the source of future traffic that is driving the need to widen Dresslerville Lane and Riverview Drive from two lanes to four lanes.
Author: Planning Commission member, verbally at the 11/8/16 meeting of the Planning Commission.
Response: The Land Use Element of the Master Plan identifies several receiving areas within the Gardnerville Ranchos Community Plan. Two of the largest of those receiving areas are located immediately adjacent to Long Valley Road/Dresslerville Road on the east side of the road and adjacent to the existing development on the south side of the Ranchos. Completion of Muller Parkway, needed to address level of service deficiencies downtown, will make the Dresslerville Road/Riverview Drive connection more attractive to traffic leaving and returning to the Gardnerville Ranchos. No change was made to the draft Transportation Plan in response to this comment.
13. **Comment:** There were suggestions that the functional classification for Ironwood Drive Extension be downgraded from a Major Collector to a local road.
Author: Two County Commissioners and several members of the public, verbally at the 12/1/16 meeting of the Board of County Commissioners.
Response: The Board of County Commissioners took no action regarding the Draft Transportation Plan at the meeting. The Board continued the item so that it could be heard by the next Board, after seating two new Board members in January 2017. A special meeting of the new Board was held July 17, 2017 to review the functional classification of Ironwood Drive. At the meeting Parsons recommended that Ironwood Drive Extension be designated as Not an Emergency Access Route. Those in attendance who had previously wanted a change in the functional classification were in agreement with this recommendation. Language has been added to the Transportation Plan under section 4.7 Emergency Access Routes and Flooding that reads "*Ironwood Drive Extension is specifically designated as not an Emergency Access Route.*"

Douglas County Complete Street Policy Statement

Policy Statement: In the County of Douglas, Nevada, Complete Streets are designed, operated, maintained and enforced to provide safety and accessibility for ALL users of our roadways, including pedestrians, bicyclists, motorists and transit users of all ages and abilities. By adopting this Complete Street Policy, the Douglas County Regional Transportation Commission not only expects but recognizes:

1. All project proposals should strive to make the existing street network safer and better for all motorists, transit users, bicyclists and pedestrians.
2. The importance of routine planning, design, connectivity, operation, maintenance and enforcement of streets to be safe for travelers of all ages and abilities, regardless of mode.
3. All projects requiring approval from the County (public and private) including all new development proposals, infrastructure, and roadway maintenance projects should be designed as Complete Streets.
4. To provide context sensitive, aesthetic improvements for new and existing roadways that best meet the needs and desires of the community.
5. Site contextual design and engineering of complete streets solutions consistent with current best practices and from nationally recognized standards.

Definition: Complete Streets are streets intended for everyone's use. Complete Streets are designed and operated to enable safe access and comfortable accommodations for all users of all ages and abilities including pedestrians, bicyclists, transit riders, and motorists. As an added benefit, Complete Streets support economic development and enhances the visual experience for users.

In addition to accommodating motorists on the roadway, Complete Streets focuses on the needs of travelers outside that group, those with disabilities, and those who travel by transit, bicycle, or on foot, and who have oftentimes been overlooked in the transportation planning process. Many neighborhoods lack safe places to walk or bicycle. Access to key community resources such as parks, shops grocery stores, and schools, is often limited to automobile traffic.

Complete Streets is about safety and efficiency as well. Many people are injured or killed each year while walking or bicycling and frequently the constructed environment is a contributing factor. Though the County has historically had relatively few accidents involving pedestrians and bicyclists, they have occurred and there is always room for improvement. In terms of efficiency, improvements can be made to the transit infrastructure to better accommodate the movement of buses and ease the transition between modes of travel. Complete Streets seeks to develop integrated, connected networks of streets that are safe and accessible for all people. Complete Streets makes active transportation such as

walking and bicycling more convenient; provides increased access to employment centers, commerce, and educational institutions; and allows more traveling options so that transportation is less of a financial burden. Complete Streets also improve the quality of life in the community by enhancing the aesthetic environment. The term "Complete Streets" means much more than the physical changes to a community's streets. Complete Streets means changing transportation planning, design, maintenance, and funding decisions. A Complete Streets policy ensures that, from the start, projects are planned and designed to meet the needs of every community member, regardless of their age, ability, or how they travel. Doing so allows a community to save money by getting the design right the first time and avoiding costly retrofits, accommodating more people by improving options for those that may be limited by existing mode choices, and creating an environment where every resident can travel safely and conveniently. Complete Streets provides a better quality of life, often through measurable environmental benefits, and can spur economic development.

All Users/Modes: The need for streets that are designed, built, and operated to accommodate pedestrians and bicyclists as legitimate users of the transportation system, in addition to motorized users, cannot be understated. However, this policy must be applied to take into consideration not only various modes, but the needs of the individual and unique users across those modes. Infrastructure improvements must consider the needs of families, youth and the elderly, those with varying physical abilities, diversity of income levels, and cultural identity and values.

Improvements should also accommodate a variety of users within specific modes. For example, where appropriate, accommodations for motorized vehicles include motorcycles, freight, and buses to name a few. In addition to pedestrians and bicyclists, improvements should consider skateboards, strollers, wheelchairs and other means of active transportation. Consideration should be given not only to the types of individual modes, but the ease of transition between them. Oftentimes, people rely on multiple modes to reach their destination which, at a minimum, generally requires some amount of walking.

All Projects/Phases: This policy must apply to all phases of a project from the initial planning, through design, and during construction. Once a project is constructed, the planned maintenance and operations of facilities should be viewed in light of this policy. Whether the project is of new construction or retrofitted, large or small in scope, Complete Streets should be an aspect of the project at all stages. The entire right-of-way, and not just the roadway, should be included in the focus on any project.

Funding may be an obstacle to implementing projects and achieving the desired outcome. This policy recognizes that it may not always be feasible to construct an entire project at one point in time that is entirely inclusive of Complete Streets goals. However, it is intended that a continued effort and commitment will be demonstrated to achieve Complete Streets incrementally through a series of smaller improvements when this is the case.

Exceptions: There may be certain exceptions to implementing Complete Streets on a small number of projects. However, each project should be carefully evaluated and have documented justification as to why it is not feasible or practical to implement all Complete Streets measures. The following is a list of a

few possible exceptions or situations that may prevent the implementation of Complete Streets measures.

1. Accommodation is not necessary on corridors where specific users are prohibited, such as interstate freeways.
2. The cost of accommodation is excessively disproportionate to the need and potential benefit of the probable use. A cost-benefit analysis should be applied to reach this determination in situations where there is not a clear benefit.
3. A documented absence of current and future need. The existing and planned population, employment densities, traffic volumes, or level of transit service around a particular roadway is so low that future expected users of the roadway will not include pedestrians, public transportation, freight vehicles, or bicyclists.
4. The project involves only ordinary maintenance activities designed to keep assets in acceptable condition, such as cleaning, sealing, spot repairs, patching and surface treatments, such as micro-surfacing.

Network: Projects should be implemented so as to establish connectivity within the existing street network. Developing connections to existing pedestrian and bicycle facilities whenever possible is encouraged and will improve the overall safety and accessibility to those that are dependent on those modes. Complete Streets concepts should be applied to private developments where feasible to eliminate “islands” with no connection to the outside network. The private sector should be held to Douglas County standards and to the essence of Complete Streets concepts for proposed developments to ensure that the intent of this policy carries through approved site plans and the entire development process.

Jurisdiction: This policy applies to all Douglas County-funded projects as well as privately funded projects or developments within Douglas County. To the greatest extent possible, County staff will work with Towns, State and Tribal entities to encourage them to implement Complete Streets concepts on projects within their respective jurisdictions.

Design Recommendations: Douglas County will attempt to utilize the best and latest design standards available and will refer to those nationally accepted standards when implementing projects. The following is a list of sources that provide nationally recognized standards:

- The National Complete Streets Coalition – <http://CompleteStreets.org>
- The National Association of City Transportation Officials (NACTO) Urban Bikeway Design Guide – <http://nacto.org/cities-for-cycling/design-guide/>
- American Association of State Highway and Transportation Officials (AASHTO) Guide for the Development of Bicycle Facilities – https://bookstore.transportation.org/collection_detail.aspx?ID=116
- Public ROW Accessibility Guidelines (PROWAG) – <http://www.accessboard.gov/guidelines-and-standards/streets-sidewalks/public-rightsofway/background/revise-draft-guidelines>
- Federal Highway Administration (FHWA) <http://safety.fhwa.dot.gov>

- Douglas County 2014 Bicycle Plan
<http://www.douglascountynv.gov/documentcenter/view/3936>

Context Sensitivity: Above all, flexibility must be retained when choosing design standards for various elements of a project, realizing that not all standards lend themselves to a “one size fits all” approach. Innovative practices should be researched and considered where appropriate. Public input should be sought from residents and non-residents alike that will be directly affected by a proposed project. A design that might be appropriate for one area of the community may not be acceptable in a different area. The underlying concept behind Complete Streets is to design for the needs of the users of the roadway.

ADOPTED ON THIS 19 day of January, 2016, by the Douglas County Regional Transportation Commission.

Carl Ruschmeyer, P.E. Director of Public Works

Greg Lynn, Chairman, Douglas County Regional Transportation Commission

Nancy McDermid, Douglas County Regional Transportation Commission
